### ECONOMIC COMMISSION FOR EUROPE

INLAND TRANSPORT COMMITTEE

World Forum for Harmonization of Vehicle Regulations (WP.29) (One-hundred-and-thirtieth session, 24-27 June 2003, agenda items 5.2. and B.2.1.1.)

### PROPOSAL TO DEVELOP A GLOBAL TECHNICAL REGULATION CONCERNING DOOR LOCKS AND DOOR RETENTION COMPONENTS

Transmitted by the representative of United States of America

<u>Note</u>: This document contains a proposal for a global technical regulation (gtr), regarding door locks and door retention components, to be developed under the 1998 Agreement concerning the establishing of Global Technical Regulations for wheeled vehicles, equipment and parts which can be fitted and/or be used on wheeled vehicles. The text is based on a document distributed without a symbol (informal document No. 6) during the one-hundred-and-twenty-ninth session of WP.29 and it is being submitted by the United States of America to WP.29 and AC.3 for consideration. The comparison of the provisions of Federal Motor Vehicle Safety Standard (FMVSS) No. 206 and ECE Regulation No. 11 was added by the United States of America after the session and is annexed to the proposal (TRANS/WP.29/909, para. 141).

This document is a working document circulated for discussion and comments. The use of this document for other purposes is the entire responsibility of the user. Documents are also available via the INTERNET:

http://www.unece.org/trans/main/welcwp29.htm

#### **Objective of the proposal**

In the U.S., between 1994 and 1999, complete and partial ejections resulted in approximately 9,864 fatalities and 9,767 serious injuries per year. Door ejections accounted for 1,668 of those fatalities (19 %) and 1,976 of the serious injuries (22 %). Hinged side door openings accounted for approximately 90% of all door ejection fatalities and 93 % of all door ejection serious injuries. This situation is likely to be a problem elsewhere.

The objective of this proposal is to develop a global technical regulation regarding door locks and door retention components intended to reduce door latch system failures. In view of the 1998 Global Agreement, we now have an opportunity to develop an improved and harmonized door locks and door retention components regulation. Moreover, the work on the global regulation will provide an opportunity to consider in the new regulation most, if not all, international safety concerns as well as available technological developments.

The US is currently looking into upgrading its door locks and door retention components regulation to provide more stringent requirements. The current regulation was designed to test for door openings in vehicles that were built in the 1960s. Changes in vehicle latch designs common in the 1960s and 1970s have rendered the existing regulations largely obsolete. Likewise, the ECE regulation is now over 30 years old. Neither regulation has been amended significantly since their original adoption. Accordingly, the existing regulations have become less effective and likely do not provide many safety benefits at this time.

In light of the US regulatory upgrade effort, we believe that this would be an excellent opportunity for the international community to develop a GTR concurrently with the US. Everyone could benefit from harmonization and new technology-based improvements of the door locks and door retention components regulation. The benefits to the governments would be the improvement of the door locks and door retention components adoption of the best safety practices, the leveraging of resources, and the harmonization of requirements. Manufacturers would benefit from reduction of the cost of development, testing and fabrication process of new models. Finally the consumer would benefit by having better choice of vehicles built to higher, globally recognized standards providing a better level of safety at a lower price.

#### **Description of the proposed regulation**

The current requirements only test individual latch components without regard to how those components interact with each other, with other portions of the door, or with the directions of force loading conditions occurring in real world crashes. Door openings are frequently caused by a combination of longitudinal and lateral forces during the crash, which can subject the latch system to compressive longitudinal and tensile lateral forces. These forces often result in structural failures of the latch system as well as other non-latch systems such as hinge strike supports, door frame and door sheet metal. Hence, it would be beneficial to consider developing full system requirements. In addition, current requirements have no test procedure for evaluating the safety of sliding doors. Consideration of such requirements would be valuable.

The GTR will be applicable for passenger vehicles, multi-purpose vehicles as well as trucks. The performance and test requirements for the door latch, striker and hinges will be based on the stringency needed to attain reasonable safety benefits in a cost effective manner. The GTR will be developed based in part on existing national regulations, directives of contracting parties as well as the international standards and regulations listed below. The US prepared a table to facilitate comparison of the present US and ECE regulations, which are currently being widely used by many contracting parties. The table is annexed to this proposal.

The results of additional research and testing conducted by any contracting parties since the existing regulations were promulgated will also be factored into the requirements of the draft GTR and may result in the proposal of new requirements.

Elements of the GTR, which cannot be resolved by the Working Party will be identified and dealt with in accordance with protocol established by AC.3 and WP.29. The proposed GTR will be drafted in the format adopted by WP.29 (TRANS/WP.29/882).

#### **Existing regulations and directives**

Though there are no regulations currently contained in the Compendium of Candidates, the following regulations and standards will be taken into account during development of the new global technical regulation regarding door locks and door retention components.

- UN/ECE Regulation 11 Uniform provisions concerning the approval of vehicles with regard to door latches and door retention components.
- U.S. Code of Federal Regulations (CFR) Title 49: Transportation; Part 571.206: Door locks and door retention components.
- EU Directive 70/387/EEC, concerning the doors of motor vehicles and their trailers.
- Canada Motor Vehicle Safety Regulation No. 206 Door locks and door retention components.
- Japan Safety Regulation for Road Vehicle Article 25 Entrance
- Australian Design Rule 2/00 Side Door Latches and Hinges.

#### **International Voluntary Standards**

- SAE J839, September 1998 Passenger Car Side Door Latch Systems
- SAE J934, September 1998 Vehicle Passenger Door Hinge Systems

### Annex

### COMPARISON BETWEEN FMVSS No. 206 and ECE REGULATION No. 11

| DOOR<br>COMPONENT    | U.S FMVSS 206   | Differences in ECE R11.02  | Comments  |
|----------------------|---|--|---|
| A. Application       |   |  |   |
| 1. Vehicles          |   |  |   |
| a. Passenger<br>Cars | - Side doors, door locks, latches and hinges  | - Side doors, latches and hinges on<br>M1 and N1 passenger cars (<9 seats<br>and < 3.5 tonnes (~7,000 lb))                         |   |
|                      | - Back doors, door locks, latches and<br>hinges on passenger cars<br>manufactured after Sept 1, 1997 and<br>with a GVWR $\leq$ 4,536 kg<br>(10,000 lb). | Not specified  |   |
| b. MPVs              | - Side doors, door locks, latches and hinges  | <ul> <li>Side doors, latches and hinges on</li> <li>M1 and N1 MPVs (≤ 9 seats and</li> <li>&lt; 3.5 tonnes (~7,000 lb))</li> </ul> |   |
|                      | Back doors, door locks, latches and hinges on MPVs manufactured after Sept 1, 1997 and with a GVWR $\leq$ 4,536 kg (10,000 lb).                         | Not specified  |   |
| c. Trucks            | - Side doors, door locks, latches and hinges  | <ul> <li>Side doors, latches and hinges on<br/>M1 and N1 Trucks (&lt;9 seats and</li> <li>3.5 tonnes (~7,000 lb))</li> </ul>       |   |
|                      | Back doors, door locks, latches and<br>hinges on trucks manufactured after<br>Sept 1, 1997 and with<br>a GVWR $\leq$ 4,536 kg (10,000 lb).              | Not specified  |   |
| 2. Exemptions        | Folding, roll-up and detachable<br>doors and door components on doors<br>modified for use with a wheelchair<br>lift system                              | See above  |   |
| <b>B. Requiremen</b> | ts  |  |   |
| 1. Hinged Side       | Doors, (Except Cargo)   |  | 1   |
| a. Door System       | Not specified   | Not specified  | Research shows that<br>door components<br>affect one another<br>during a crash<br>causing doors to<br>open. Therefore, a<br>full door system test<br>may capture these<br>failures. |

| DOOR<br>COMPONENT                               | U.S FMVSS 206   | Differences in ECE R11.02   | Comments  |
|---|---|---|---|
| b. Latching<br>System<br>(latch and<br>striker) | Requires that hinged side door<br>latches must have a fully latched<br>position; and a secondary/<br>intermediate latching position.  | Same  |   |
|   | Requires that hinged side door<br>latches must withstand a<br>longitudinal load of 11,000 N in the<br>fully latched position and 4,450 N<br>in the secondary latched position<br>Requires that hinged side door<br>latches must withstand a transverse<br>load of 8,900 N in the fully latched<br>position and 4,450 N in the<br>secondary latched position<br>Requires that the door latch   | Requires that hinged side door<br>latches must withstanding a<br>longitudinal load of <u>11,110 N</u> in the<br>fully latched position and <u>4,440 N</u> in<br>the secondary latched position.<br>Requires that hinged side door<br>latches must withstand a transverse<br>load of <u>8,890 N</u> in the fully latched<br>position and <u>4,440 N</u> in the secondary<br>latched position | The variation in loads<br>are minor and they<br>result from different<br>methods of<br>converting FMVSS<br>206's original<br>English units to<br>metric   |
|   | assembly shall not disengage from<br>the fully latched position when a<br>longitudinal or transverse load of<br>30g is applied to the door latch<br>system (including the latch and its<br>actuating mechanism with the<br>locking mechanism disengaged).<br>Verified by calculation (SAE J839)<br>or by an agency approved test<br>procedure.  | move from the fully latched position<br>when an acceleration of 30g is<br>applied in both directions<br>longitudinally and transversally to the<br>latch, including its actuating<br>mechanism, with the locking<br>mechanism disengaged. Verified by<br>calculation (SAE J839) or by<br><b>dynamic inertial testing</b>  | provisions for an<br>inertial dynamic<br>testing procedure.<br>However, it is<br>unknown whether<br>European<br>manufacturers and<br>testing facilities<br>have ever<br>conducted testing<br>using this<br>procedure. |
| c. Hinges                                       | Requires that each side door hinge<br>system must support the door and<br>withstand a longitudinal load of<br>11,000 N and a transverse load of<br>8,900N applied separately.<br>Not specified  | Requires that each side door hinge<br>system must support the door and<br>withstand a longitudinal load of<br><u>11,110 N</u> and a transverse load of<br><u>8,890 N</u> applied separately.<br>Requires that the retention<br>components of hinged mounted side<br>doors, other than folding doors, shall<br>be mounted at the forward edge in<br>the direction of travel.                 | Minor differences in<br>test loads resulting<br>from conversion.<br>ECE 11 requires that<br>hinged side doors,<br>except cargo doors,<br>have hinges located<br>on the front of the                                   |
| Door Locks                                      | Requires that each door shall be<br>equipped with a locking mechanism<br>with an operating means in the<br>interior of the vehicle.<br>Requires that side front door locks,<br>when engaged, disable the outside<br>door handle or other outside latch<br>release control shall be inoperative<br>Requires that side rear door locks,<br>when engaged, disable both the<br>outside and inside handles or other<br>latch release controls shall be | Not specified Not specified Not specified   | door.   |

| DOOR<br>COMPONENT                                | U.S FMVSS 206   | Differences in ECE R11.02  | Comments  |
|--|---|--|---|
| 2. Hinged Side                                   | Doors, Cargo Type   | I  |   |
| a. Door System                                   | Not specified   | Not specified  | A better test is<br>needed to address the<br>number and<br>orientation of cargo<br>door latches and<br>better simulate actual<br>loading conditions<br>that cause openings. |
| b. Latching<br>Systems<br>(latch and<br>striker) | Requires that each hinged side cargo<br>door latches must only have a<br>primary latching position  | 1. Requires that each hinged side<br>cargo door latches must only have a<br>primary latching position <u>and a</u><br><u>secondary/intermediate latching</u><br><u>position.</u>   | FMVSS 206 does not<br>have a requirement<br>and strength<br>provisions for the<br>intermediate latching<br>position   |
|  | Requires that hinged side door<br>latches must withstand a<br>longitudinal load of 11,000 N in the<br>fully latched position<br>Requires that hinged side door<br>latches must withstand a transverse<br>load of 8,900 N in the fully latched<br>position | Requires that hinged side door<br>latches must withstanding a<br>longitudinal load of <u>11,110 N</u> in the<br>fully latched position and <u>4,440 N</u> in<br>the secondary latched position.<br>Requires that hinged side door<br>latches must withstand a transverse<br>load of <u>8,890 N</u> in the fully latched<br>position and <u>4,440 N</u> in the secondary<br>latched position  | Conversions<br>differences in test<br>loads and ECE 11<br>has strength<br>provisions for the<br>intermediate latching<br>position   |
|  | Not specified   | Requires that the door latch shall not<br>move from the fully latched position<br>when an acceleration of 30g is<br>applied in both directions<br>longitudinally and transversally to the<br>latch, including its actuating<br>mechanism, with the locking<br>mechanism disengaged. Verified by<br>calculation (SAE J839) or by<br><b>dynamic inertial testing</b>   | ECE 11 requires<br>inertial resistance for<br>sliding door latches,<br>whereas FMVSS 206<br>does not.   |
| Hinges   | Requires that each side door hinge<br>system must support the door and<br>withstand a longitudinal load of<br>11,000 N and a transverse load of<br>8,900 N applied separately.<br>Not specified   | Requires that each side door hinge<br>system must support the door and<br>withstand a longitudinal load of<br><b>11,110 N</b> and a transverse load of<br><b>8,890N</b> applied separately<br>Requires that the retention<br>components of hinged mounted side<br>doors, other than folding doors, shall<br>be mounted at the forward edge in<br>the direction of travel. In the case of<br>double doors, this requirement shall<br>apply to the door wing, which opens<br>first; the other wing shall be capable<br>of being bolted | Conversions<br>differences in test<br>loads<br>ECE 11 restricts the<br>location of hinges   |

| DOOR<br>COMPONENT                                | U.S FMVSS 206   | Differences in ECE R11.02   | Comments  |
|--|---|-----------------------------|---|
| Door Locks                                       | Requires that each door shall be<br>equipped with a locking mechanism<br>with an operating means in the<br>interior of the vehicle.   | Not specified               | ECE 11 has no lock requirements   |
|  | Requires that side front door locks,<br>when engaged, disable the outside<br>door handle or other outside latch<br>release control shall be inoperative   | Not specified               |   |
|  | Requires that side rear door locks,<br>when engaged, disable both the<br>outside and inside handles or other<br>latch release controls shall be<br>inoperative  | Not specified               |   |
| 3. Hinged Back                                   | Doors   | 1                           |   |
| a. Door System                                   | Not specified   | Not specified               | Because of number<br>and orientation of<br>back door latches, a<br>door system test<br>would better simulate<br>actual loading<br>conditions that cause<br>doors to open. |
| b. Latching<br>Systems<br>(latch and<br>striker) | Each back door must have at least<br>one primary latch and striker<br>assembly with a fully latched<br>position and a secondary latched<br>position   | Not specified               | ECE 11 has no<br>requirements for<br>back doors, locks,<br>latches or hinges.   |
|  | Requires that primary back door<br>latches must comply with load tests<br>one, two and three as well as to<br>inertial resistance requirements  | Not specified               |   |
|  | Requires that auxiliary back door<br>latches, if present, must comply<br>with load tests one and two and<br>inertial resistance requirements  | Not specified               |   |
|  | Load test one:<br>Fully latched: 11,000 N secondary<br>latch: 4,450 N <i>Application of load</i> :<br>perpendicular to the face of the<br>latch (corresponding to the<br>longitudinal load test for side doors)<br>Load test two:<br>Fully latched: 8,900 N secondary<br>latch: 4,450 N <i>Application of load</i> :<br>in the direction of the fork-bolt | Not specified Not specified |   |
|  | opening and parallel to the face of the latch   |                             |   |
