Methodology of The Nexus Assessment of a Transboundary Basin

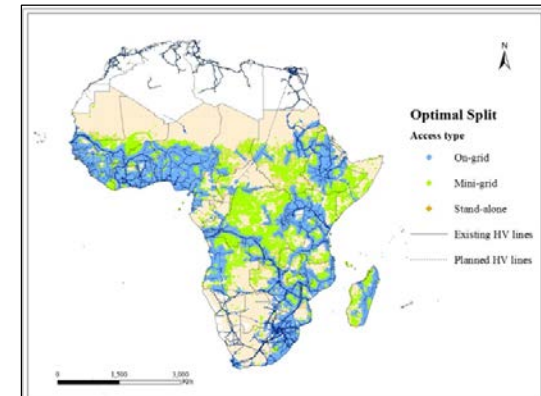

Analytical tools developed by KTH-dESA:

OSeMOSYS
Open Source Energy Modelling System

www.osemosys.org

OnSSET
Open Source Spatial Electrification Tool

www.onsset.org

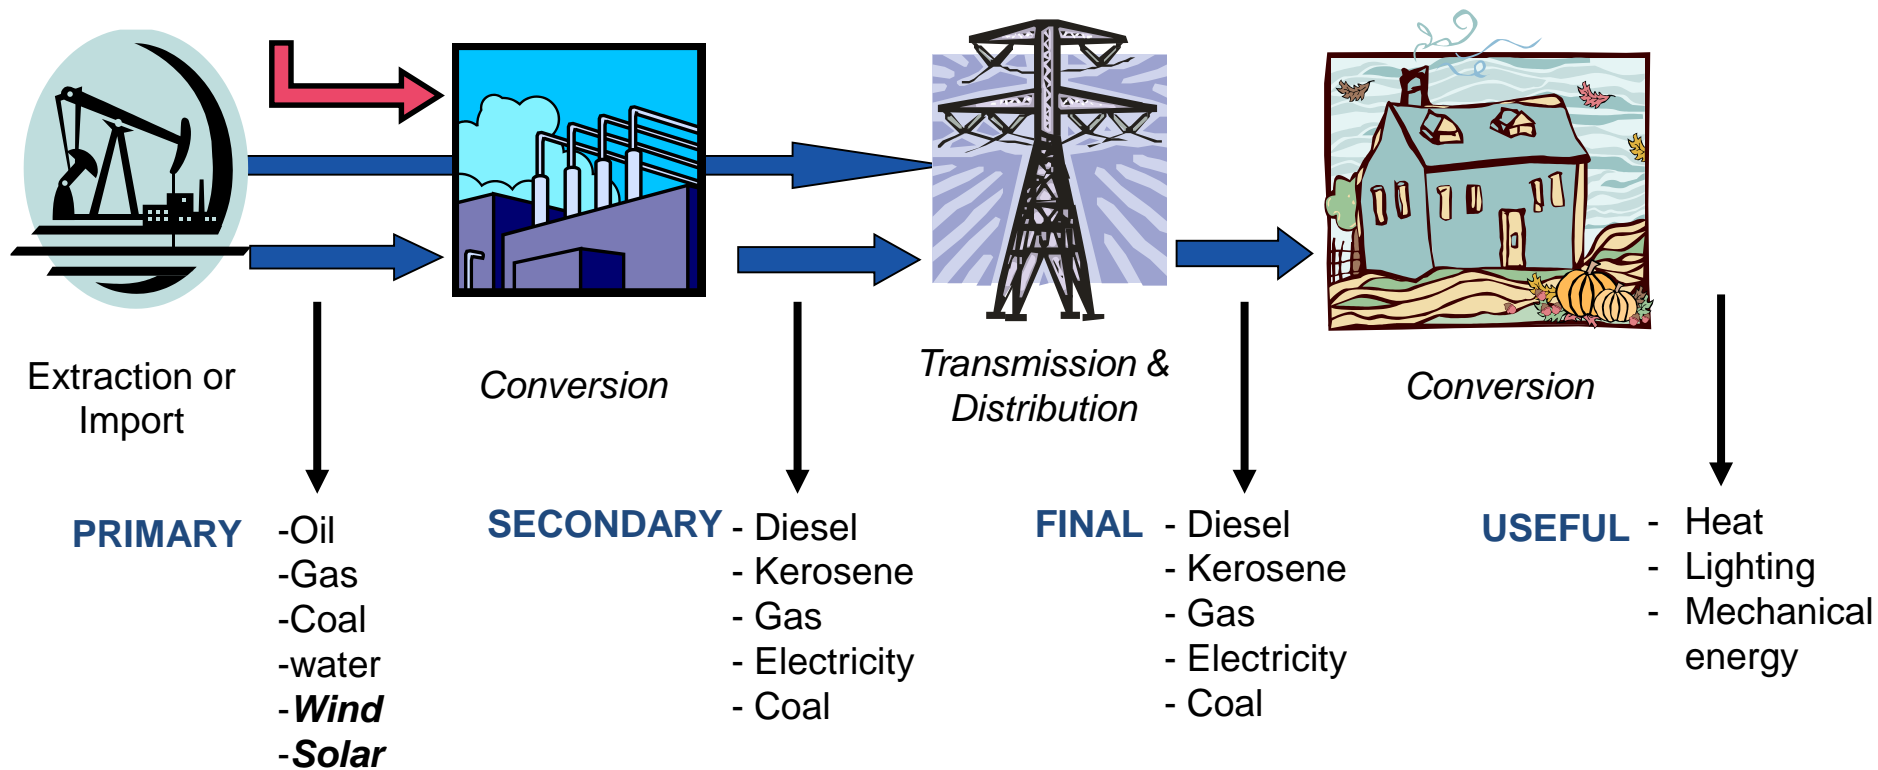

Open Source energy MOdelling SYStem (OSeMOSYS)

- Model generator converting the energy system structure represented by equations into a matrix to be solved by specific solvers
 - Open source
 - Dynamic
 - *Linear optimisation*

What we mean by Energy System

What does OSeMOSYS do?

It determines the energy system configuration with the **minimum total discounted cost** for a time domain of decades, constrained by:

- **Demand for energy** (e.g. electricity, heating, cooling, km-passengers, etc.) that needs to be met
- **Available technologies** and their techno-economic characteristics (Levelised Cost of Electricity, efficiency, lifetime, etc.)
- **Emission taxations**, generation targets (e.g. renewables)
- **Other constraints** (e.g. ramping capability, availability of resources, investment decisions, etc.)

OSeMOSYS in the nexus framework

Aims at:

- providing stakeholders with policy relevant insights about key **inter-linkages and dynamics** of the energy-food-water nexus
- **identifying robust relationships** (i.e. impacts/relationships that are true for a wide range of conditions/assumptions)

Nexus case studies under UNECE framework:

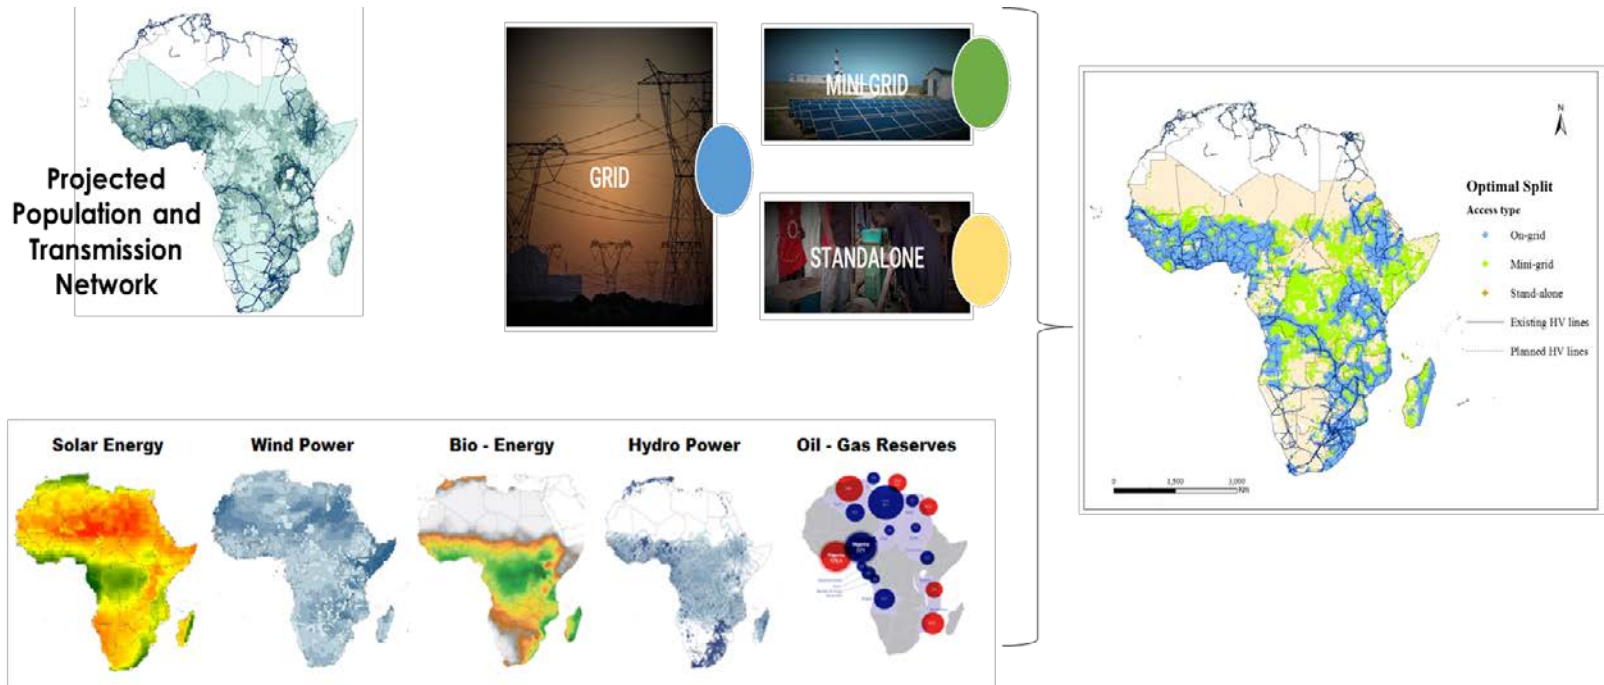

- ✓ Sava River Basin (2014 – 2016)
- ✓ Drina River Basin (2016 – 2017)

Other contributions of OSeMOSYS

- Continental electricity system models of **South America** and **Sub-Saharan Africa**, developed in collaboration with **World Bank**
- Country models of **Nicaragua**, **Bolivia** and **Uganda** developed in collaboration with **UNDESA** and employed for capacity building to the **Governments**
- Detailed country model of **Cyprus**, providing insights for the natural gas outlook to the **Ministry of Energy, Commerce, Industry and Tourism**.
- Among the United Nations **“Modelling Tools for Sustainable Development Policies”**, in collaboration with **UNDESA and UNDP**.

Open Source Spatial Electrification Tool (OnSSET)

GIS and Energy System Models

Medium to long-term national energy system models such as OSeMOSYS, TIMES, MESSAGE etc. typically do not take into account the spatial fluctuations of energy resources and demand side.

- Intermittent energy resources (such as wind, solar, hydro, diesel supply) vary in time and space.
- Power infrastructure and energy demand differ from one area to another.

Without GIS models, these details, which are essential in energy planning, cannot be captured.

GIS and energy planning

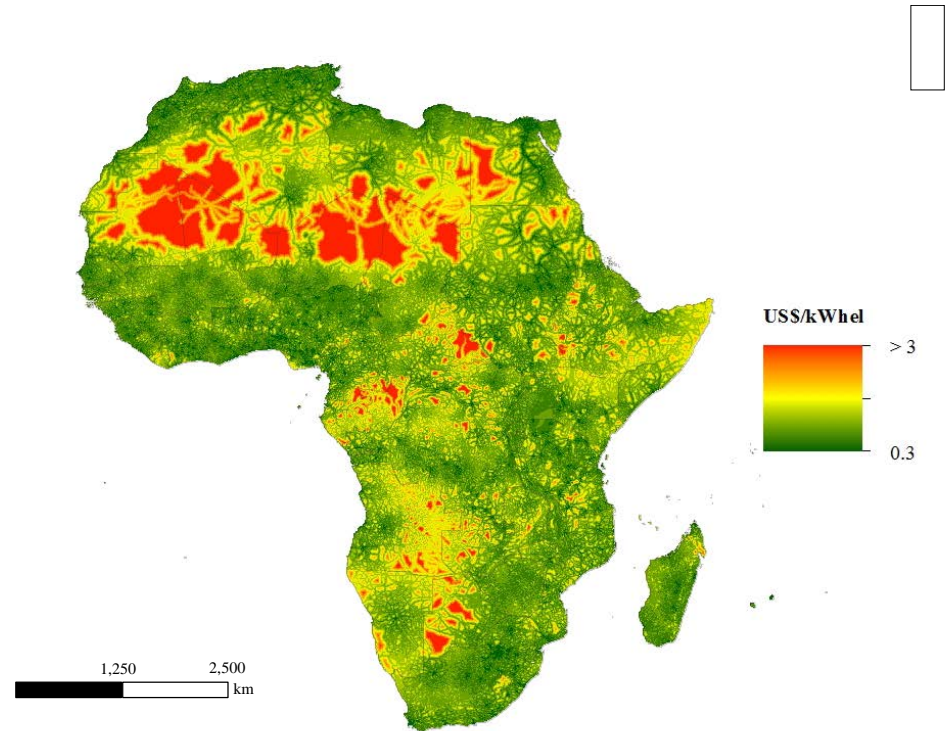

Spatial datasets for an electrification planning analysis:

Categories	Datasets
Resources	Wind Solar Hydro Oil
Infrastructure	Road network Transmission network Power plants Night-time lights

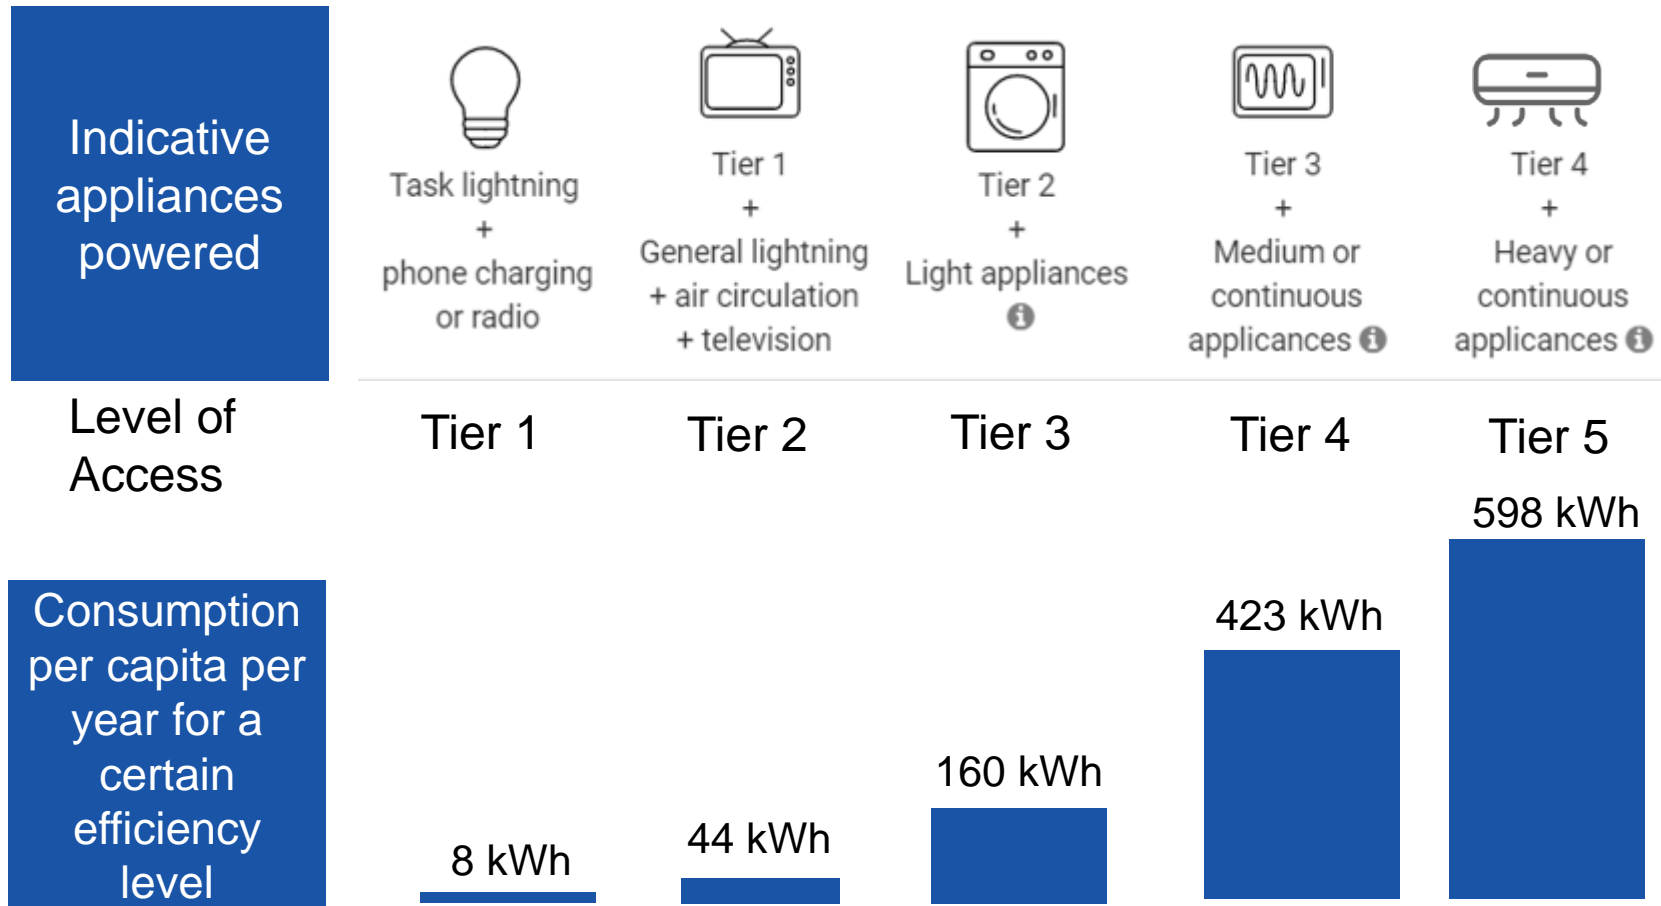

Categories	Datasets
Demand side	Population density Population growth Administrative boundaries Urban/rural split
Economic activities	Mining and Quarrying sites

The role of GIS in energy planning and energy access

- Administrative boundaries
- Road network
- Nighttime light
- Power plants
- Mines
- Existing Grid Network
- Current population
- Projected population and Grid Network
- Wind power capacity factor
- Global Horizontal Irradiance
- Mini and small hydropower potential
- Spatial cost of Diesel gensets

The role of GIS in energy planning and energy access
