

# From Pathways to Sustainable Energy to Carbon Neutrality Project

## Item 6: Presentation of results and recommendations of the project “Pathways to Sustainable Energy”

8<sup>th</sup> session of the Group of Experts on Gas  
26 March 2021, Geneva

# UNECE Region – Reality Check

## ENERGY

- 80% of today's energy mix in the UNECE region is fossil-based.
- No economically-rational scenario involves a substantial fall in fossil energy.
- Even in a climate change scenario that meets a 2°C target, fossil fuels would account for 56% of primary energy in 2050.
- Dependence on fossil fuels makes achieving carbon neutrality an imperative.

REF Scenario – business as usual, based on the Shared Socio-economic Pathway

NDC Scenario – based on country level NDCs as pledged by countries

P2C Scenario – assumes attainment of the 2°C target by 2100

For more information see project Pathways to Sustainable Energy: <https://www.unece.org/energy/pathwaystose.html>

# Natural gas remains the “king”

## ENERGY

- 30% higher electricity demand is expected by 2050.
- Significant structural changes in electricity generation portfolio across UNECE region.
- Natural gas and hydrogen play key role.

REF Scenario – business as usual, based on the Shared Socio-economic Pathway

NDC Scenario – based on country level NDCs as pledged by countries

P2C Scenario – assumes attainment of the 2°C target by 2100

For more information see project Pathways to Sustainable Energy: <https://www.unece.org/energy/pathwaystose.html> 3

# When you find yourself in a hole, stop digging

## ENERGY

**UNECE countries must cut/capture at least 90Gt of CO<sub>2</sub> by 2050 to meet 2°C. There are variety of pathways to attain carbon neutrality in the UNECE region.**

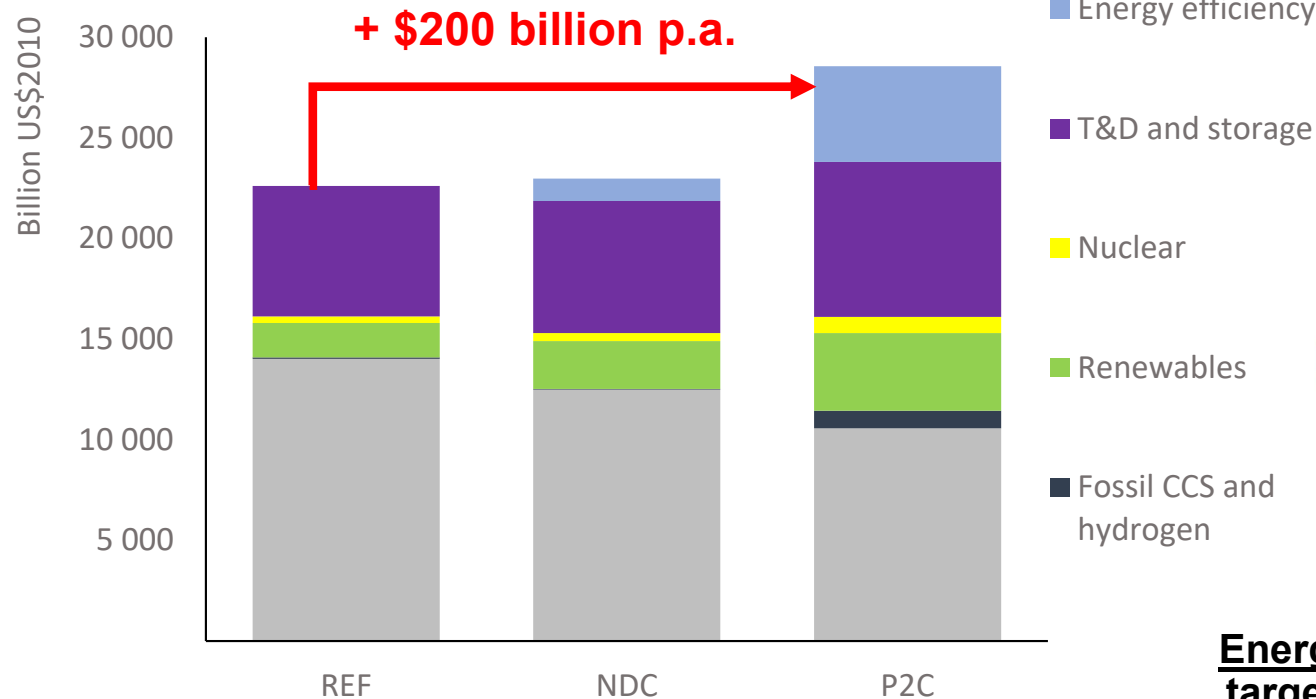

# Delay is expensive!

ENERGY

## Comparing investment requirements - UNECE REF, NDC and P2C scenarios (2020 – 2050)

**Energy transition cost increase to meet 2°C target is negligible compared to social and health costs. Air pollution ALONE cost \$1.8 trillion in 2015 in OECD and BRIICS\* combined**

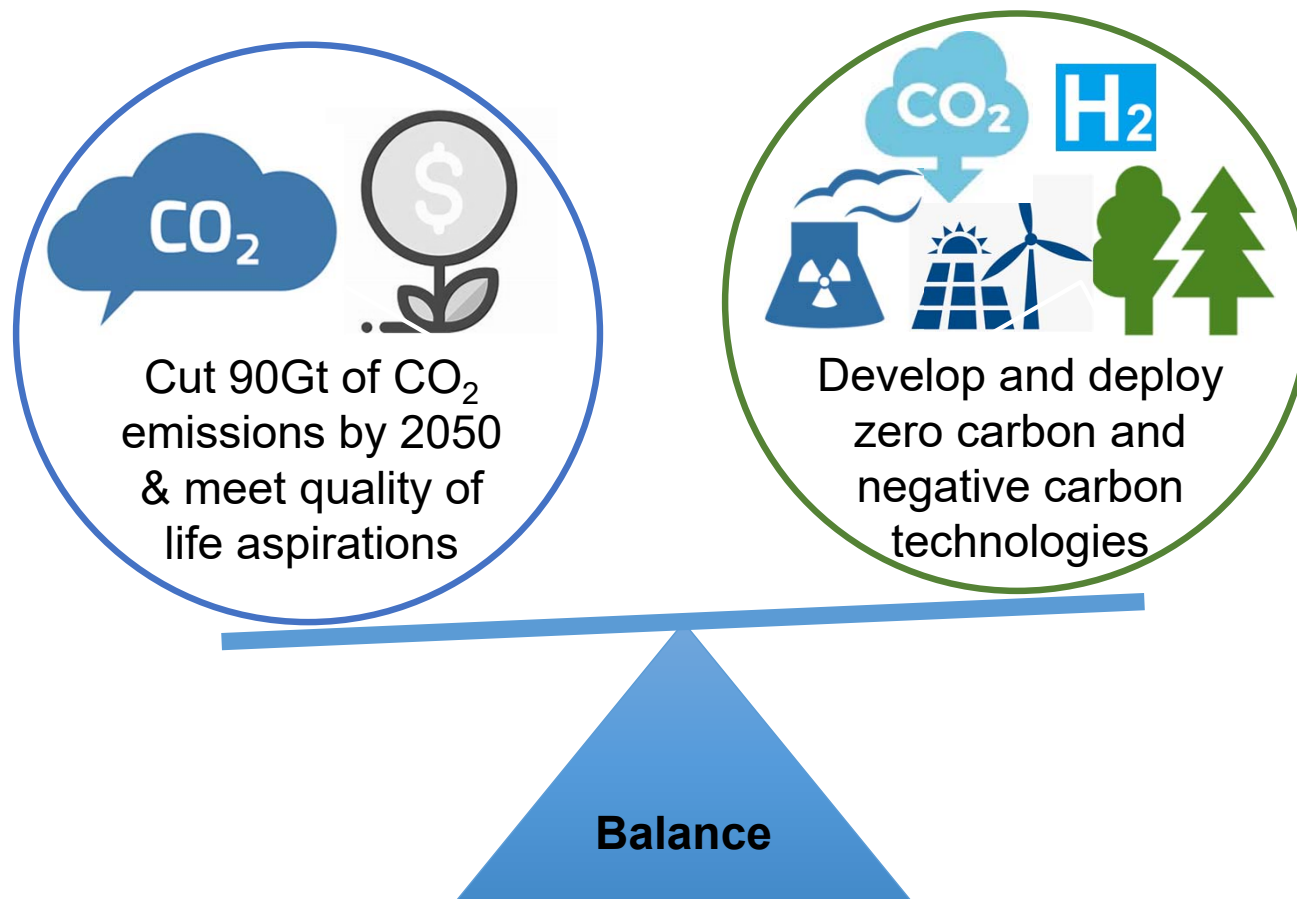

- T/D&S: transmission, distribution and storage of electricity and district heat
- CCS: carbon capture and storage

# Attaining carbon neutrality is the first step towards achieving sustainable energy

ENERGY

UNECE Group of Experts on Cleaner Electricity Systems initiated a project to explore how to move to carbon neutrality across power and energy intensive industries in the UNECE region.

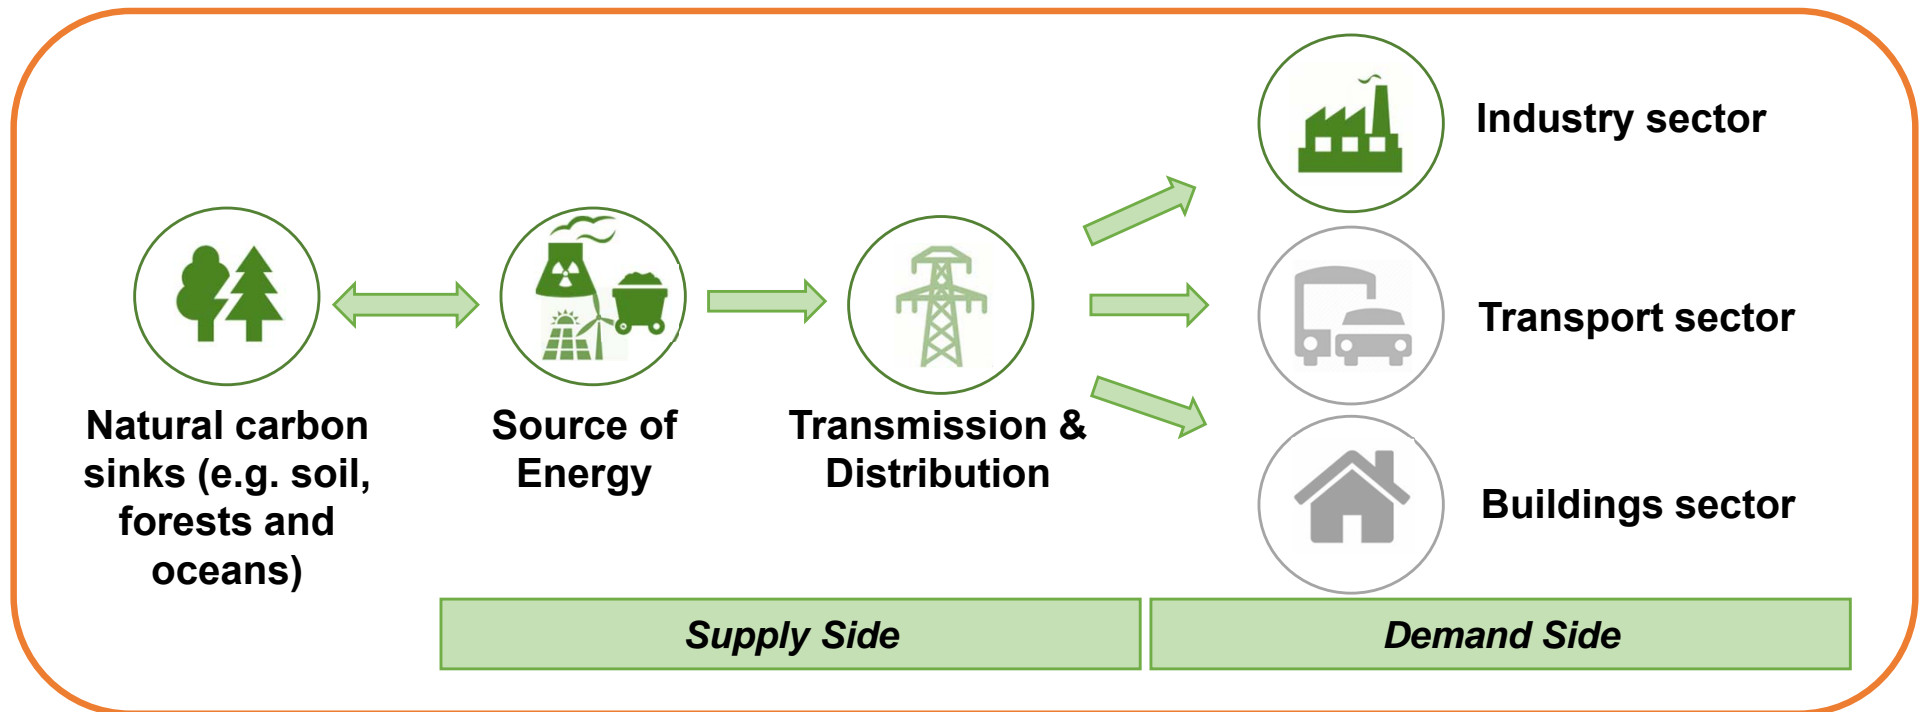

# What are the elements of the carbon neutrality framework? Whole System Approach with Power and Energy Intensive Industry Focus

ENERGY

**Starting position: Whole System Approach** → Attaining carbon neutrality – balancing emissions with equal carbon removal – through natural systems, sector coupling and integrated approach. Developing a roadmap to 2050 for the UNECE region.

# What are the elements of the carbon neutrality framework?

ENERGY

**Attaining carbon neutrality in the UNECE region by 2050 !**

**Targets for power sector and energy intensive industries to cut carbon emissions**

Energy Supply	Energy Infrastructure	Energy Demand	Carbon sinks
<p>KPIs:</p> <ul style="list-style-type: none"> <li>• Available resources</li> <li>• New technology deployment</li> <li>• Energy self-sufficiency</li> <li>• Diversity of energy supply</li> <li>• Free trade of energy resources</li> <li>• Availability of capital</li> <li>• Standardization</li> <li>• ...</li> </ul>	<p>KPIs:</p> <ul style="list-style-type: none"> <li>• Interconnecting infrastructure (pipelines, LNG terminals, HV lines etc.)</li> <li>• State of existing energy infrastructure; 3<sup>rd</sup> party access</li> <li>• New and planned energy infrastructure projects</li> <li>• Availability of capital</li> <li>• Standardization</li> <li>• ...</li> </ul>	<p>KPIs:</p> <ul style="list-style-type: none"> <li>• Energy access</li> <li>• Energy affordability</li> <li>• Monetizing emissions &amp; incentivizing emissions cuts</li> <li>• Efficiency improvements</li> <li>• Post-Covid-19 behavioral changes</li> <li>• ...</li> </ul>	<p>KPIs:</p> <ul style="list-style-type: none"> <li>• reforestation</li> <li>• Use of land</li> <li>• Oceans</li> <li>• Sustainable use of biomass</li> <li>• ...</li> </ul>

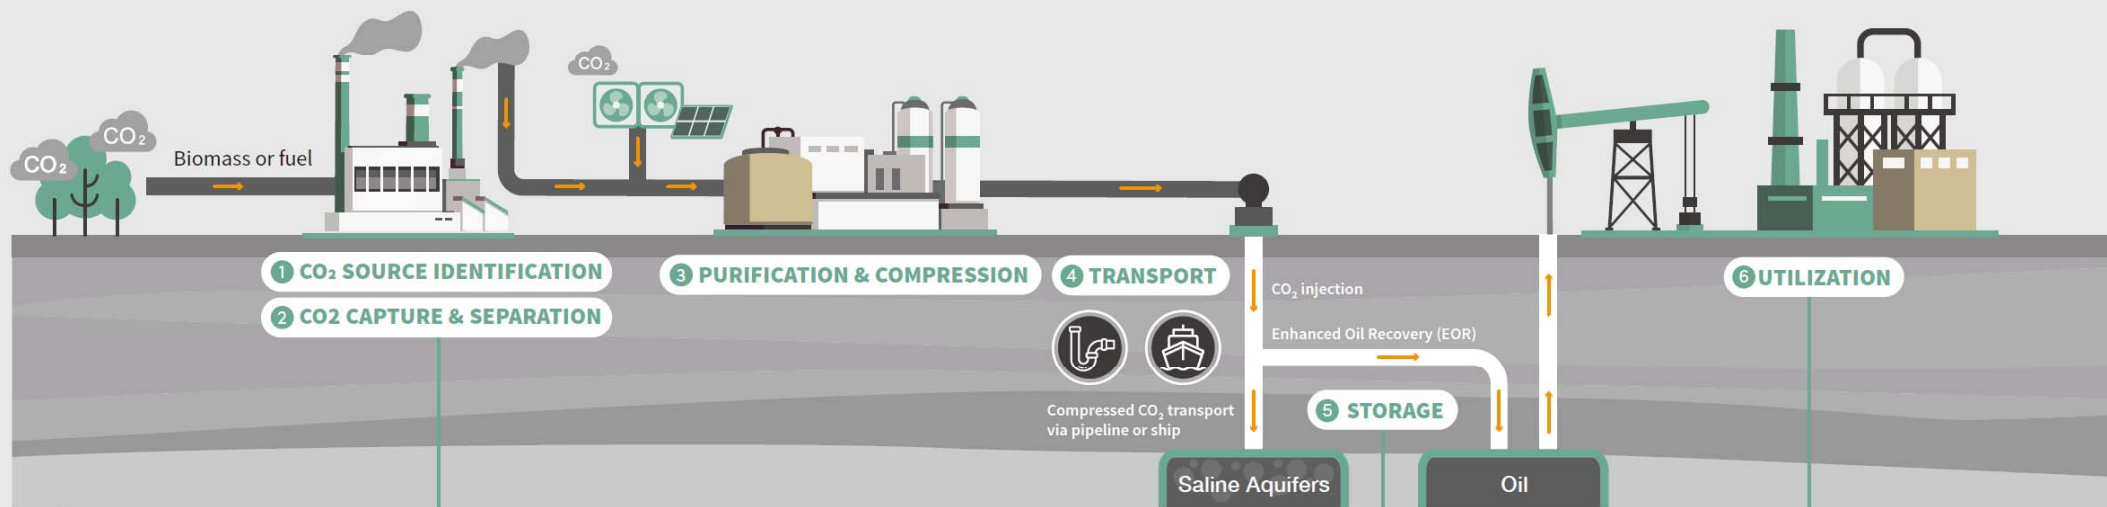

**Scenarios to attain carbon neutrality based on different technology options and across all UNECE subregions**

Technologies			
<p><b>renewable energy</b> <b>CCS/ CCUS</b></p>	<p><b>nuclear energy</b> (incl. SMR, nuclear fusion) <b>hydrogen</b> (from RE and fossil fuels w CCS) <b>biomass w CCS</b></p>	<p><b>fossil fuel</b> (coal, gas, oil) <b>energy storage</b> (batteries, power-to-X, hydro) <b>direct air capture</b></p>	<p><b>HELE</b></p>

# CARBON CAPTURE, USE AND STORAGE (CCUS)

CCUS is essential to unlock the full potential of decarbonisation and attain carbon neutrality

## Point Sources of CO<sub>2</sub> in Industry

CO<sub>2</sub> from industries (cement, steel), hydrogen production from fossil fuels, or power generation is captured before it reaches the atmosphere and is then compressed and injected into porous rock layers.

## Biomass Energy with Carbon Capture and Storage (BECCS)

## Direct Air Carbon Capture and Storage (DACCS)

BECCS and DACCS can in effect capture CO<sub>2</sub> from any fossil fuel source anywhere in the world, before or after the fossil CO<sub>2</sub> is released.

Also, they are essential for achieving net zero CO<sub>2</sub> emissions, making it more certain and less costly.

## Saline Aquifers for Sequestration of CO<sub>2</sub>

Saline aquifers are geological formations containing brine in porous rock at depths over 1km. CO<sub>2</sub> can be pumped down into the rock for sequestration.

## Enhanced Oil Recovery (EOR)

EOR is a family of techniques that increases the recovery of oil and gas while storing CO<sub>2</sub>. Dependent on operational choices, the volume of CO<sub>2</sub> stored could exceed the CO<sub>2</sub> content of the produced hydrocarbons.

- Building Materials**  
Aggregate, concrete
- Chemicals**  
Methanol, ethanol
- Plastics**  
Polymers
- Mineralization**  
Carbonates

Carbon utilization can unlock the commerciality of CCUS projects for the industrial sector, steel, cement and chemical. Building materials and chemicals produced from CO<sub>2</sub> have great potential to sink CO<sub>2</sub> while the low price of existing products make market penetration challenging.

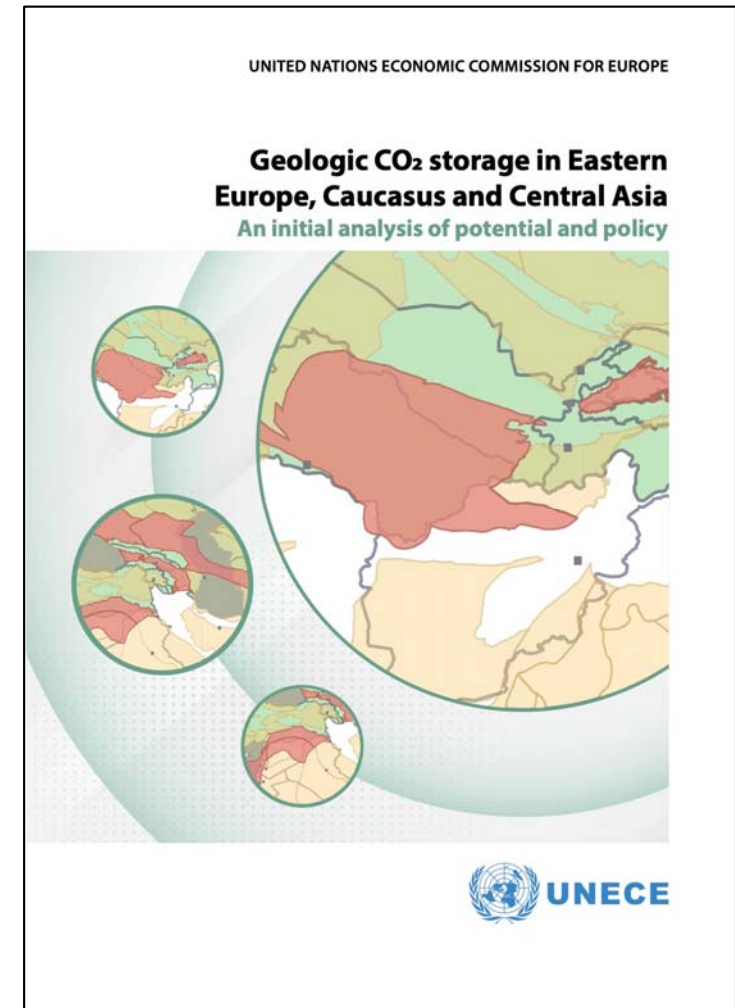

- Awareness**  
Recognise CCUS as a viable climate mitigation option and consider it when developing national plans.
- Acceptance**  
Develop and integrate policies to allow full commercialisation of CCUS technologies.
- Finance**  
Create a funding mechanism for CCUS and direct investments towards modernization of energy infrastructure.

# Eastern UNECE region can play leading role in CO<sub>2</sub> storage

## ENERGY

- **Storage potential of 62,000 Mt of CO<sub>2</sub>, with 56,410 MtCO<sub>2</sub> in Russia. Azerbaijan, Kazakhstan and Turkmenistan follow with smaller suitable carbon sinks.**
- **The report highlights several tools and methodologies for countries to enact**
  - **EU's Emissions Trading Scheme**
  - **United States' tax credit incentives**
- **A key proposal from the study: certification scheme for carbon storage to facilitate significant CO<sub>2</sub> storage and finance CCUS projects**

# HYDROGEN VALUE CHAIN

Hydrogen, an innovative solution for achieving carbon neutrality

## PRODUCTION

### FUEL-BASED PRODUCTION

**Natural gas**  
Steam reforming  
with or without  
CCS

**Coal**  
Gasification  
with or  
without CCS

**Biomass**  
Gasification  
with or  
without CCS

Steam reforming & gasification

### ELECTRICITY SYSTEM

**Nuclear**  
Electricity and heat  
from nuclear power

**Renewable energy**  
Electricity from wind,  
solar, hydro or  
geothermal power

Electrolysis

H<sub>2</sub>

## CONVERSION, PROCESSING & TRANSPORTATION

### PURE H<sub>2</sub>

### PROCESSING

- Liquefaction & regasification
- Compression

### CONVERSION

- **Haber-Bosch process**  
ammonia or methanol
- **Methanization**  
synthetic natural gas

## STORAGE

Liquefied H<sub>2</sub> in storage tanks

Geological storage in underground salt caverns

## USE

TRANSPORT

BUILDINGS

INDUSTRY

POWER

### Awareness

Recognise hydrogen as a viable climate mitigation option

### Acceptance

Develop and integrate policies to jumpstart hydrogen economy

### Finance

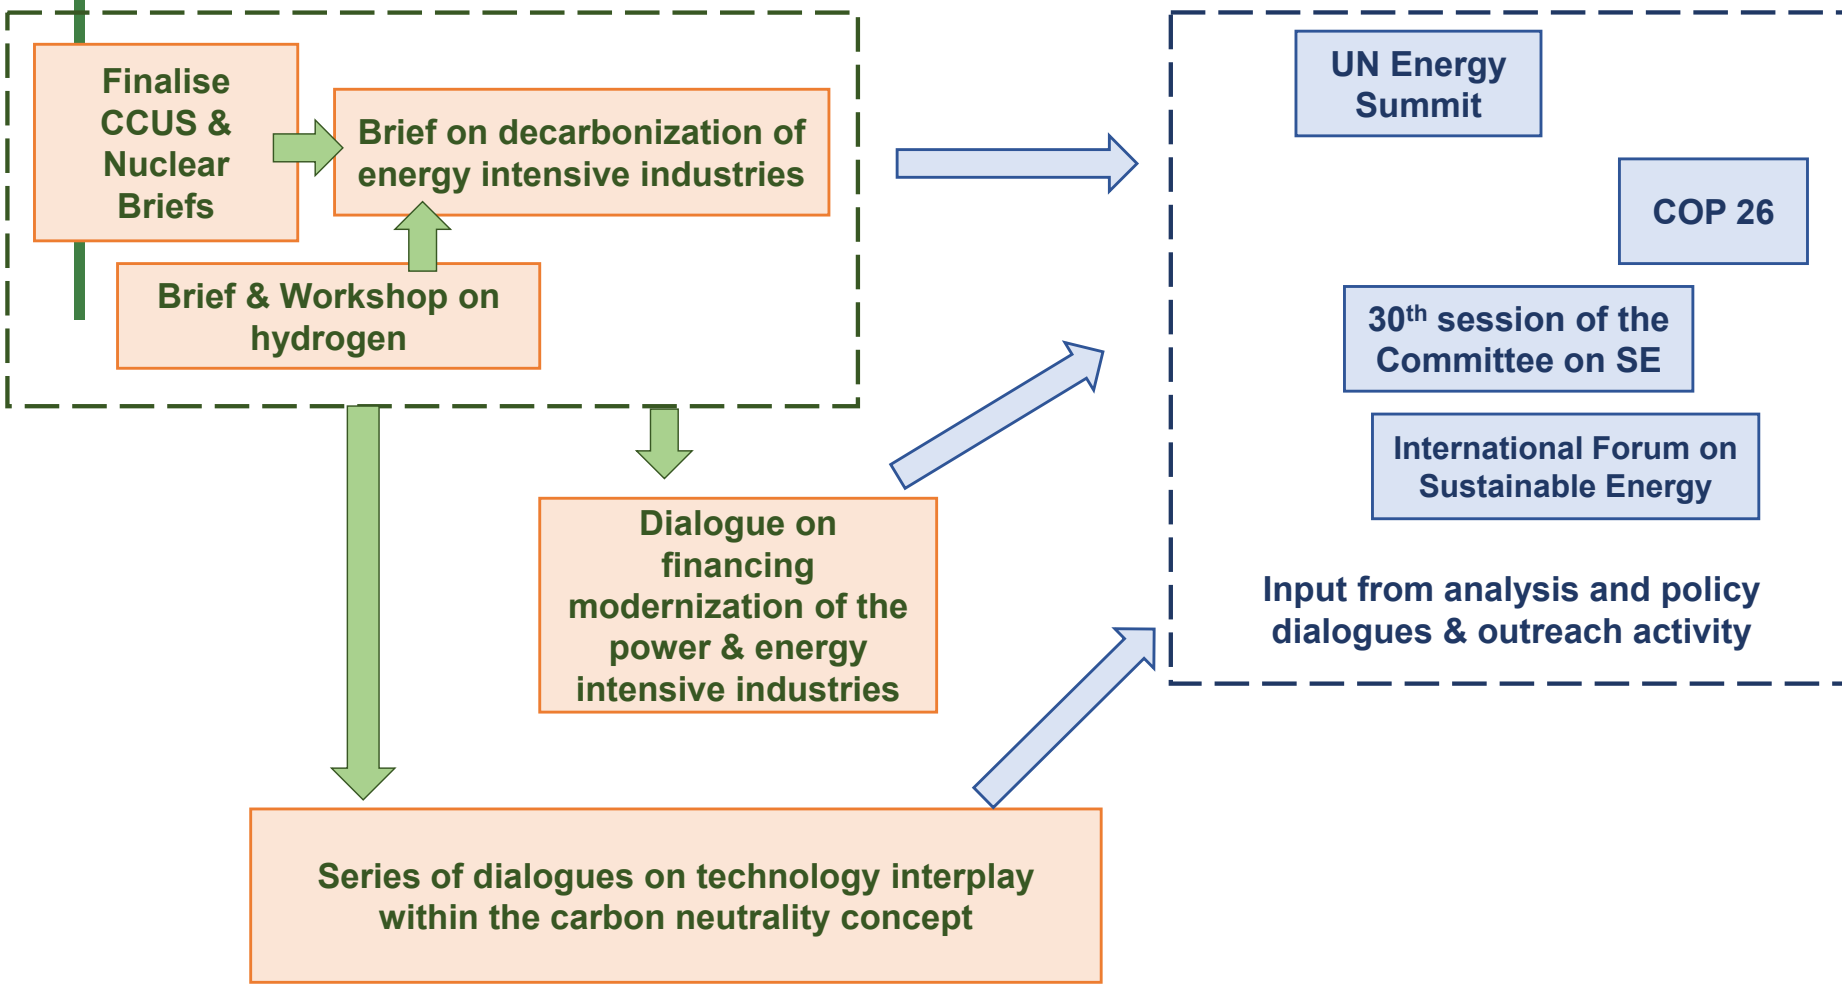

Direct public and private investment into clean hydrogen projects

# Carbon Neutrality Project Activities

ENERGY

## Timeline for 2021:

Thank you!

# More Insights

# Project Design and Objectives

ENERGY

## ***How can the UNECE Region attain Sustainable Energy (SE)?***

- **Current Phase:** May 2017 – Oct 2019
- **Outputs**
  - **Pathways and Scenario Development**
    - Sub-regional modelling of SE scenarios to 2050
    - Policy and technology options
  - **Policy dialogue**
    - Adaptive policy pathways
    - Policy dialogues
    - Sub-regional workshops
  - **“Early-warning system” concept**
    - SE Targets
    - Key Performance Indicators (KPIs)
    - Signposts

# Defining Sustainable Energy

## Three Pillars

ENERGY

### ***“Secure the energy needed for economic development”***

- Energy Efficiency (energy intensity of economy, rate of improvement of energy intensity, conversion efficiency)
- Fuel mix
- Net energy trade
- Investment requirements

### ***“Minimize adverse energy system impacts on climate, ecosystems & human health”***

- GHG emissions from the energy system
- Energy-related air pollution, water use & water stress

### ***“Provide affordable energy that is available for all at all times”***

- Access to energy services
- Energy affordability
- Food security (biomass use)

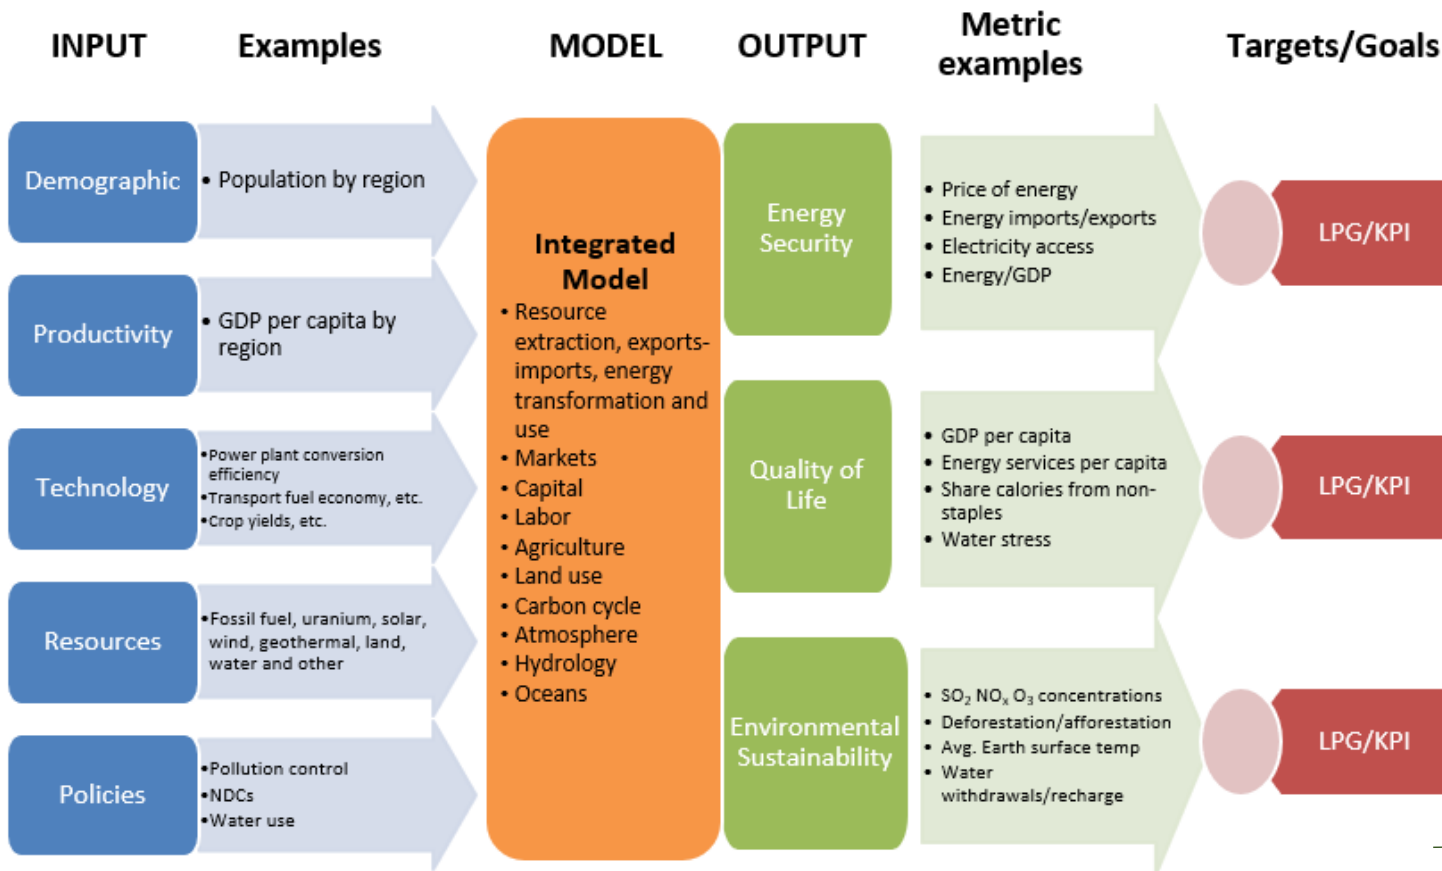

# Scenario development

## Illustration of scenario design

ENERGY

### Scenario Analysis

### REFERENCE SCENARIO

Based on shared socio-economic pathway

### NDC SCENARIO

Implements by 2030 the NDC under the Paris Agreement – NDCs forever

### P2C SCENARIO

2-Degree target of the Paris Agreement as the key component of Sustainable Energy
