

Statistics of run-in tests

- Statistics requirements of CoP testing should also apply, in some form, to run-in testing.
- The deviations (spread, σ) with respect to the fit line can be the basis of the safety margin for the run-in effect.

Statistics of run-in tests

- Statistics requirements of CoP testing should also apply, in some form, to run-in testing.
- The deviations (spread, σ) with respect to the fit line can be the basis of the safety margin for the run-in effect.

$$CO_{2-fit}[D] = A - B * \log\left[\frac{D_i - D_s}{1 \text{ km}}\right]$$

$$\sigma = \sqrt{\frac{\sum (X_{measured}[D] - X_{fit}[D])^2}{N-2}}$$

Margin on run-in effect: $B \rightarrow B - \sigma$
