### **Economic Commission for Europe**

Committee on Forests and the Forest Industry

**Eightieth session** 

Geneva, 2-4 November 2022 Items 2 and 6(g) of the provisional agenda Urban forests in context and Urban forestry matters

### **Draft Regional Urban Forestry Opportunity Plan**

### Submitted by the Secretariat

### Summary

This draft document was prepared by the secretariat under the project "Sustainable urban forestry as a cost-effective nature-based solution for green, resilient, and healthy development in the United Nations Economic Commission for Europe (UNECE) region" (Switzerland, ECE-E395). It identifies opportunities for action to expand sustainable urban and peri-urban forestry in the UNECE region.

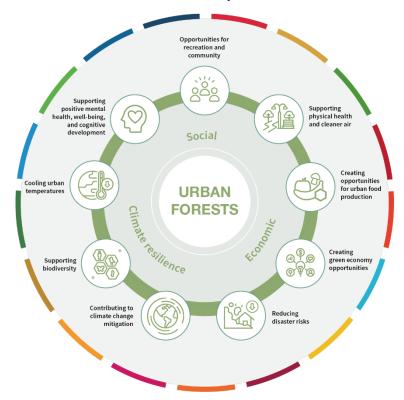

This draft document is presented for information and background for discussions on urban forestry work to provide recommendations.

### I. Introduction

1. Forests, trees, and other vegetation in urban areas make important contributions to the creation of resilient, healthy, and vibrant cities. As highlighted in the United Nations Economic Commission for Europe (UNECE) policy brief on Sustainable Urban and Periurban Forestry (SUPF)1, urban and peri-urban forests (UPF) provide important nature-based solutions for sustainable and resilient urban development. This includes essential contributions to climate action, public health promotion, biodiversity conservation, food security and economic development (see Figure 1). Indeed, the many contributions of urban forests to greener, healthier, and happier cities for all have received increasing recognition in recent years, such as the "Call for Action" of the 2018 World Forum on Urban Forests<sup>2</sup>.

Figure 1 **The Potential of Urban and Peri-urban Forestry** 

Source: United Nations Economic Commission for Europe, 2022.

- 2. Optimising the ecosystem services and benefits provided by urban and peri-urban forests requires a strategic approach to SUPF, implementing policies and programmes from the local to the international levels. Efforts should be based on long-term planning to manage and expand urban and peri-urban forest cover in a manner that maximizes benefits for all. This depends not only on planting trees, but also ensuring that they are cared for and kept healthy over the long-term. A cross-sectoral approach will be critical for building capacities in urban forestry and engaging with urban planning, public health, tourism, and other sectors. This cross-sectoral approach will contribute to many development challenges and objectives, including the Sustainable Development Goals (SDGs), Global Forest Goals, climate action, disaster risk reduction, biodiversity conservation, landscape restoration and sustainable cities.
- 3. In the UNECE region, this includes important contributions to sustainable cities. The UNECE policy brief 'Place and Life in the ECE'<sup>3</sup> recommends a three-pronged approach to building more resilient, inclusive, and sustainable cities post-COVID-19, including: 1) tackling inequalities and development deficits; 2) strengthening the capacities of local actors (particularly local governments) and; 3) pursuing a resilient, inclusive and green economic recovery. SUPF has an important role to play in meeting all three components, with focus on the environmental qualities and resources of cities, as also highlighted by the Geneva United

Nations Charter on Sustainable Housing<sup>4</sup>. Post-Covid-19 recovery and rebuilding in cities could prioritise green, gender-responsive, and sustainable pathways, including a focus on enhancing local climate resilience using SUPF as a nature-based solution. Equitable access must be provided to urban infrastructure and facilities, including urban and peri urban green space and forests, with a specific focus on vulnerable groups, as also stressed in SDG target 11.7 on sustainable urban communities. Good governance and data-driven approaches for building urban resilience are also called for.

- 4. When strengthening the contributions of SUPF to healthier, more resilient, and more liveable cities, it is important to work collaboratively and in a coordinated way, with a wide range of actors and stakeholders at various levels. An important aspect of this are the many different owners of forests, including local governments, national states, sub-national governments, not-for-profits, private owners and community actors. Local authorities throughout the UNECE region own millions of hectares of forests, but much less is known about the trees outside forests under local authority ownership. The frequently fragmented ownership of urban and peri-urban forests is a challenge for cohesive and strategic planning and management.
- 5. Due to forest loss and fragmentation in urban areas, there is often an urgent need for forest landscape restoration and tree planting. The National Policy Guiding Principles for Forest Landscape Restoration<sup>5</sup> can assist in this effort. Providing an integrating framework that can be applied across a range of land uses to ensure that key ecosystem goods and services are available for future generations. Principles related to increasing awareness, developing supportive governance and greening non-forest sectors align with identified opportunities for action to strengthen SUPF.
- 6. This document outlines opportunities for action to enhance SUPF throughout the UNECE region, focusing on cross-sectoral and cross-scale collaboration between actors.

#### A. Common Terms

- 7. For the purposes of this paper, the following definitions are used for commonly used terms:
- (a) Sustainable urban and peri-urban forestry (SUPF): is defined as "the art, science, and practice of planning, designing, establishing, and managing urban and peri-urban forests to meet current needs and desires of society for the benefits these provide, without compromising the availability of these for future generations". Although the focus is on forests and trees as determining components, SUPF also links to the wider green and blue infrastructure in urban areas.
  - (b) **UNECE region:** refers to the region comprised of UNECE member States.
- (c) **Local Authority:** refers to authorities with legislative, judicial, and executive authority of local government units, such as cities and towns. This often refers to the smallest geographic areas distinguished for administrative and political purposes, <sup>7</sup> although many cities may be comprised of multiple district or neighbourhood authorities with more limited mandates. Local authorities may refer to communities including, but not limited to, municipalities, cities, towns, townships, and villages.
- (d) **Sub-national:** refers to the governance level of provinces, cantons, states and so on, excluding the level of local authorities.
- (e) **Private sector:** refers to private owners and business entities, private institutions and other private ownership arrangements.
- (f) **Civil society:** refers to non-governmental organizations, not-for-profits and similar entities.
- (g) **Financial Institution:** includes financial institutions and funding entities that provide access to capital in different forms.
- (h) **Urban Area**: comprises a city or town proper and also the suburban fringe or thickly settled territory that may be lying outside, but adjacent to, its boundaries.<sup>8</sup>

#### **B.** Overarching Principles

- 8. Sustainable urban and peri-urban forests are a nature-based solution and form part of the critical infrastructure of sustainable cities. To maximize ecosystem services over time, they should:
  - (a) Be resilient, sustainable, and multifunctional;
- (b) Be properly planned, designed, established and managed over time as part of an interconnected socio-ecological network;
  - (c) Equitably provide benefits to all segments of urban populations.
- 9. While afforestation and tree planting are important, proper management and stewardship over time are critical to ensuring that urban trees can grow old and provide the fullest range of ecosystem services.
- 10. To ensure this, SUPF must adopt the following approaches:
- (a) It is critical to plant the right tree in the right place, for the right reasons. Urban forests are part of complex socioecological networks. Different designs of urban forests, with different trees, will yield different outcomes and benefits. Strategic long-term planning is critical to ensure that urban forests are designed to deliver on the desired benefits. This is particularly important in the context of climate change, and continuous research is needed to understand climate impacts on urban forests and to identify resilient species and ecosystem structures.
- (b) A strategic and structural approach to the sustainable management of urban and peri urban forests is required. This includes appropriate and specific governance structures and processes, policies and programs from the UNECE regional level to the local (e.g. city) level. Urban and peri-urban forests are framed in a broad perspective of forests and trees as part of wider green infrastructure and nature-based solutions. The implementation of policies will require masterplans at the city level, but also, for example, policies and legislation at national and sub-national levels.
- (c) Coordination and collaboration across sectors, boundaries and levels of governance must form the roots of SUPF. To enable and ensure good cooperation, it is critical that mandates and responsibilities of relevant stakeholders be clearly defined. Cross-sectoral collaboration should recognise, consider and enhance the contributions of SUPF to urban development, economics, public health, and other agendas, and vice-versa. Community and forest owner participation is of fundamental importance, and inclusive approaches to planning, design, management and monitoring should be promoted and protected. This should engage private sector and other civil society actors as well.
- (d) Greater awareness about the roles and benefits of SUPF and greater capacity to act will enhance outcomes, including by helping to facilitate cross-sectoral collaboration. Knowledge also needs to be generated and mobilised in support of SUPF and linked to awareness raising efforts. Dedicated training and capacity building are needed as part of these efforts to ensure that skilled professionals can implement SUPF activities.

#### C. Vision and Goals

- 11. **Vision.** Opportunities for regional actions can be framed under the following overall vision for the UNECE Region:
- (a) Urban and peri-urban forests are developed to deliver multiple essential ecosystem services that benefit local urban and peri-urban communities and contribute to national policy objectives, the SDGs, and global goals for climate action, disaster risk reduction, biodiversity conservation, landscape restoration, and sustainable cities.
- (b) Urban and peri-urban forests are managed sustainably, guided by national, subnational, and city authority policies, regulations, strategies, and plans that are implemented with adequate resources over time.

- 12. **Goals.** The following overall goals would then direct future actions, to be delivered at different levels ranging from the UNECE regional to the local level:
- (a) Raise awareness of the benefits of SUPF and the need for sustainable resource management.
- (b) Strengthen governance, policies, regulatory frameworks, and financing for SUPF at the national, sub-national, and local levels.
- (c) Provide guidance for, and enhance the development and implementation of, masterplans, management plans and good practices in SUPF.
- (d) Strengthen technical and human capacities for the implementation of SUPF programs.
- (e) Build inclusive partnerships and participatory approaches for developing and delivering SUPF programs and initiatives.
- 13. Goals can only be realised through the joint efforts of a wide range of stakeholders, from the UNECE regional to the local level (e.g. the city or even city district level).

### II. Policy Areas

### A. Policy Area A: Awareness of benefits and sustainable management

## 14. Goal A: Raise awareness of the benefits of SUPF and the need for sustainable resource management:

- (a) Although there has been increasing focus on the importance of greening cities, there is still limited awareness and knowledge about the current benefits of SUPF and its potential amongst many policymakers, local authorities, investors and professionals working in other sectors. There is also a need to raise awareness about SUPF amongst urban residents across the UNECE region.
- (b) Under this goal, the focus is on identifying, assessing, and communicating the many benefits of SUPF. Proper assessment of ecosystem services and benefits provided by SUPF, both in monetary and non-monetary terms, will be an important component of advocating for SUPF. This includes contributions to climate action, public health promotion, food security, sustainable economic development and tourism, biodiversity conservation and disaster risk reduction, among others. Awareness raising is important as cities grow and densify, often placing urban trees and forests under threat.
- (c) The growing interest in the greening of cities has resulted in numerous tree planting and afforestation initiatives. Although it is important to expand urban forests, it is just as essential that trees reach maturity which requires sound selection, establishment, and maintenance. Increasing awareness of long-term and sustainable management approaches is therefore another essential task.

	SCIVICES.		

#### B. Policy Area B: Governance, policies, and regulatory frameworks

### 15. Goal B: Strengthen governance, policies, regulatory frameworks, and financing for SUPF at the national, sub-national, and local levels.

- (a) Appropriate and specific governance structures and coordination processes, policies, and dedicated regulatory frameworks, with clear mandates, long-term goals and strategic directions are needed. These should enable, guide, support and align efforts to sustainably manage and expand urban and peri-urban forests as a nature-based solution and recognized component of the critical infrastructure of sustainable cities. This includes urban forestry policies that set clear visions and goals and have a longer-term focus, as well as the integration of urban forestry objectives in national, sub-national, and local-level policies and strategies related to, among other, climate action, public health, biodiversity conservation, food security, economic development and tourism, urban development, and risk management. Where institutional mandates for SUPF activities are not clearly defined, or where they are dispersed, governance structures may need to be clarified or revised. 2. Management plans are important for organising and directing SUPF activities. Technologies can help, for example, to ensure sufficient below- and above-ground space for trees. Given the challenging growing conditions that trees face in cities, it is essential that SUPF use appropriate technologies and current best practices.
- (b) Financing of SUPF should be longer-term and reliable, with public finance playing a critical role. Private sector involvement and other types of funding are also important. Urban forests and trees should be included in asset management at the local (e.g. city) level.

	mechanisms for SUPF.	

### C. Policy Area C: Planning and management

## 16. Goal C: Provide guidance for, and enhance the development and implementation of, masterplans, management plans and good practices in SUPF.

- (a) Urban forests can provide many benefits, but only if the right tree is planted in the right place for the right reasons, which requires careful long-term planning. Furthermore, urban forests will only provide the intended benefits if planted trees survive and grow to maturity. Management should ensure the longevity of urban trees, shifting the focus from planting to establishing and maintaining healthy mature trees.
- (b) Management plans are important for organising and directing SUPF activities. Technologies can help, for example, to ensure sufficient below- and above-ground space for trees. Given the challenging growing conditions that trees face in cities, it is essential that SUPF use appropriate technologies and current best practices.
- (c) Management should be adaptive as conditions are rapidly changing. It is important to develop an urban forest that is resilient and constituted of a mix of tree species that are adapted to climate change. Urban trees and forests should be supported by management standards developed by industry and government.
- (d) Joint research should be promoted to support the above, creating important synergies and exchanging new knowledge.

### D. Policy Area D: Technical and human capacities

# 17. Goal D: Strengthen technical and human capacities for the implementation of SUPF programs.

(a) SUPF is an interdisciplinary and highly complex field that integrates knowledge and skills on the interactions between cities and forests, trees, and people from a wide range of fields. Growing trees in often harsh urban environments requires professionals that have been educated and trained in dedicated urban forestry programs. Although there are university, vocational, and technical education and training opportunities in fields such as arboriculture, horticulture, forestry, and landscape design, comprehensive urban forestry programs are lacking. Where stand-alone programs are difficult to set up, urban forestry aspects need to be integrated into existing programs.

(b) SUPF also needs people who can provide 'green leadership' within public sector agencies, businesses, not-for-profits, and community groups.

Goal D: Strengthen technical and human capacities for the implementation of SUPF programs

the ONLOE region.	communities of practice and knowledge.	Civil Society

### E. Policy Area E: Inclusive partnerships and participatory approaches.

## 18. Goal E: Build inclusive partnerships for the development and delivery of SUPF programs at different levels.

- (a) To integrate urban and peri-urban forestry into other relevant policy domains and thereby maximize its potential as a nature-based solution, SUPF should be a cross-sectoral undertaking, involving government, private sector, and civil society stakeholders. SUPF is seldom the domain of urban forestry professionals alone: urban green spaces and trees can make essential contributions to climate, public health, biodiversity, urban planning, disaster management, tourism, and other policy domains. Affiliated professions such as architecture, landscape architecture, and ecology play essential roles, as do professions such as engineering, healthcare, and urban planning. Partnership and collaboration are needed across the urban forestry life cycle, starting with the growing of trees and other plants in nurseries.
- (b) Participatory approaches to urban forestry will contribute to successful programs as well. More inclusive place making within SUPF will build community buy-in, support, and engagement over the long term. Inclusive planning can also help to promote a more equitable distribution of urban forests and their benefits, including providing essential benefits to vulnerable groups.
