

COMMISSION INTERNATIONALE
DES GRANDS BARRAGES

INTERNATIONAL COMMISSION
ON LARGE DAMS

ICOLD Bulletin No. 194 TAILINGS DAM SAFETY

Andy Small, Chair – ICOLD Tailings Committee

Representing:

ICOLD - Committee L Tailings Dams and Waste Lagoons

Who/What is ICOLD/CIGB

- The International Commission on Large Dams (Commission Internationale des Grands Barrages), founded in 1928 is an **international, non-governmental** organization dedicated to the sharing of **professional information and knowledge** of the design, construction, maintenance, and impact of large dams.
- National Committees from more than **100 countries** with approximately **10 000 individual** members.
- ICOLD members are essentially practising engineers, geologists and scientists from governmental or private organizations, consulting firms, universities, laboratories and construction companies.
- ICOLD is an **independent professional body**.

ICOLD Committees (29)

A	COMPUTATIONAL ASPECTS OF ANALYSIS AND DESIGN OF DAMS (2020-23)
B	SEISMIC ASPECTS OF DAM DESIGN (2020-23)
C	HYDRAULICS FOR DAMS (2021-25)
D	CONCRETE DAMS (2021-24)
E	EMBANKMENT DAMS (2020-23)
F	ENGINEERING ACTIVITIES WITH THE PLANNING PROCESS FOR WATER RESOURCES PROJECTS (2014-22)
G	ENVIRONMENT (2020-22)
H	DAM SAFETY (2021-24)
HWS	HISTORICAL WATER STRUCTURE (Water Heritage) (2021-24)
I	PUBLIC SAFETY AROUND DAMS (2022-25)
J	SEDIMENTATION OF RESERVOIRS (2020-23)
K	INTEGRATED OPERATION OF HYDROPOWER STATIONS AND RESERVOIRS (2015-23)
L	TAILINGS DAMS & WASTE LAGOONS (2020-23)
LE	LEVEES (2018-2024)
M	OPERATION, MAINTENANCE AND REHABILITATION OF DAMS (2020-23)
N	PUBLIC AWARENESS AND EDUCATION (2021-24)
O	WORLD REGISTER OF DAMS AND DOCUMENTATION (2021-24)
P	CEMENTED MATERIAL DAMS (2020-25)
Q	DAM SURVEILLANCE (2017-22)
RE	RESETTLEMENT DUE TO RESERVOIRS (2021-2024)
S	FLOOD EVALUATION AND DAM SAFETY (2020-24)
T	PROSPECTIVE AND NEW CHALLENGES FOR DAMS AND RESERVOIRS IN THE 21st CENTURY (2020-23) (AD HOC Committee)
TRS	TROPICAL RESIDUAL SOILS (2020-23)
U	DAMS AND RIVER BASIN MANAGEMENT (2021-24)
V	HYDROMECHANICAL EQUIPMENT (2016-22)
X	FINANCIAL AND ADVISORY (AD HOC Committee)
Y	CLIMATE CHANGE (2021-23)
Z	CAPACITY BUILDING AND DAMS (2021-24)
ZX2	YOUNG ENGINEERS

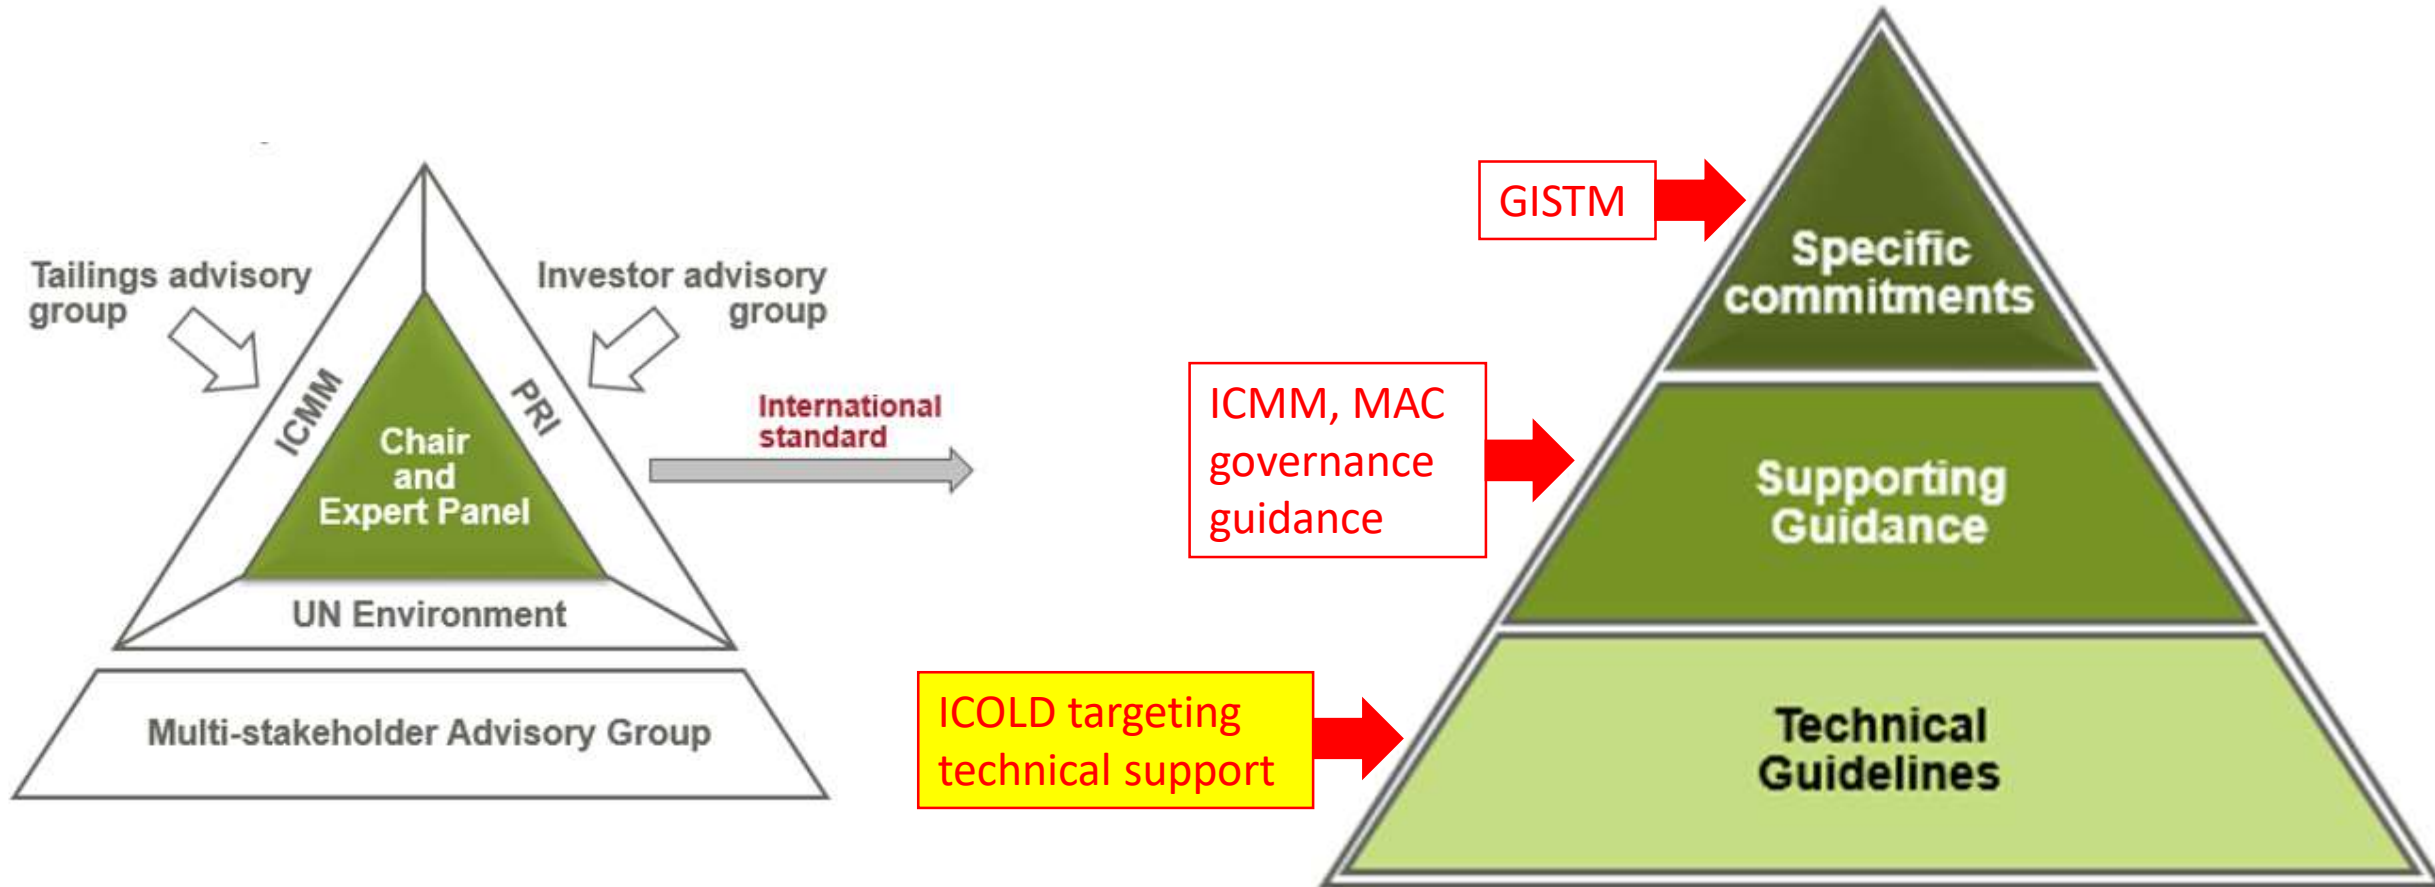

Bulletins related to tailings

- No. 45: Manual on Tailings Dams and Dumps (1982)
- No. 74: A Guide to Tailings Dam Safety (1989)
- No. 97: Tailings Dams - Design of Drainage (1994)
- No. 98: Tailings Dams and Seismicity (1995)
- No. 101: Tailings Dams Transport, Placement and Decantation (1995)
- No. 103: Tailings Dams and Environment (1996)
- No. 104: Monitoring of Tailings Dams (1996)
- No. 106: A Guide to Tailings Dams and Impoundments (1996)

COMMITTEE ON TAILINGS DAMS (2018-2022)

COMITE MATERIAUX POUR BARRAGES EN REMBLAI

BULLETIN WORKING GROUP

<i>Chairman</i> – Canada	H.N. MCLEOD (1)
<i>Vice Chairperson</i> – Sweden	A. BJELKEVIK
Australia	D. BRETT
Brazil	J. PIMENTA DE AVILA
Canada	A. SMALL (2)
Czech Republic	J. HERZA
South Africa	D. GRANT-STUART
United Kingdom	R. MONROY
United States	P.W. RIDLEN (3)
	T. ALEXEVIA (4)
Co-opted Member - Industry Representative	I. GILLANI

ADDITIONAL COMMITTEE MEMBERS

Chile	J. TRONCOSO
China	H. ZHOU
Democratic Republic of Congo	H. K. WA KITAMBO
Finland	H. NURMI
France	F. BROUSSET
Iran	M. ASKARI
Norway	Ø. TOGERSRUD
Romania	C. PRISCU
Russia	A. VAKULENKO
Slovakia	M. BAKES
Spain	F. SÁNCHO CARO
United Kingdom	R. MONROY
Zambia	P. KAMPENGELE

(1) Chairman until 2021
(2) Chairman since 2021

(3) Member since 2019
(4) Member until 2019

1.→INTRODUCTION

2.→TAILINGS STORAGE FACILITY GOVERNANCE

- 2.1. → Dam Safety Roles and Responsibilities
- 2.2. → Tailings Management System (TMS)
- 2.3. → Management of Change and Incident Reporting:
- 2.4. → Audits, Verifications and Reviews
- 2.5. → Documentation and Records

3.→CLOSURE

- 3.1. → Closure Design Principles
- 3.2. → Closure Phases
- 3.3. → Aspects of Sustainable Closure Design
- 3.4. → Landform Design

4.→DAM CONSEQUENCE CLASSIFICATION

- 4.1. → introduction
- 4.2. → Dam Consequence classification basis
- 4.3. → Dam Consequence Classification Categories

5.→SITE CHARACTERIZATION

- 5.1. → Introduction
- 5.2. → Social and Environmental Setting
- 5.3. → Physical Setting
- 5.4. → Climate and Hydrology
- 5.5. → Geological and Geotechnical Characterization
- 5.6. → Hydrogeology
- 5.7. → Seismicity

6.→TAILINGS CHARACTERIZATION

- 6.1. → Introduction
- 6.2. → Classification of Tailings
- 6.3. → Laboratory Testing and in situ Testing
- 6.4. → Geotechnical Properties

7.→DESIGN

- 7.1. → Introduction
- 7.2. → Life Phases and Design Stages of a Tailings Dam
- 7.3. → Design Steps for a New Tailings Dam
- 7.4. → Design of Raises and Ongoing Operations
- 7.5. → Risk Informed Design
- 7.6. → Dam Failure Modes
- 7.7. → Design Basis
- 7.8. → Design Criteria
- 7.9. → Slope Stability Assessment
- 7.10. → Earthquake Assessment (Seismic Stability)
- 7.11. → Seepage Design
- 7.12. → Hydrotechnical Design
- 7.13. → Environmental Design

8.→RISK MANAGEMENT

- 8.1. → Introduction
- 8.2. → Risk Assessment

8.3. → Preventative Controls and Monitoring Options

8.4. → Trigger Action Response Plans

8.5. → Monitoring

9.→DAM FAILURE/BREACH ANALYSIS

- 9.1. → Introduction
- 9.2. → Dam Breach Assessment
- 9.3. → Dam Breach Methodology

10.EMERGENCY PREPAREDNESS AND RESPONSE PLANNING

- 10.1.→Introduction
- 10.2.→EPRP Description
- 10.3.→Emergency Preparedness

11.→CONSTRUCTION

- 11.1.→Introduction
- 11.2.→Supervision and Documentation→
- 11.3.→Confirmation of Design Intent and Documentation of As-Constructed Conditions

12.→OPERATIONS

- 12.1.→Introduction
- 12.2.→Operations, Maintenance and Surveillance Manual
- 12.3.→Engineering Aspects of Operations

Appendix A: References, Definitions and

Appendix B: Shear Strength and Deformation Behavior

B.1 → Introduction

B.2 → Fundamental Concepts of Soil Behavior Under Shearing

B.2.1→Drained versus Undrained shearing conditions

B.2.2→Dilative versus Contractive Behavior

B.2.3→Strain-Hardening versus Strain-Softening

B.3 → CPT-Based Measurement of in situ State and soil properties

B.4 → liquefaction and liquefied shear Strength

B.4.1→Liquefaction

B.4.2→Post-Peak Shear Behavior

B.5 → Selection of Appropriate Shear Strength Parameters for Design and Analysis

B.6 → Special Considerations

B.6.1→Stress-dependent Behavior

B.6.2→Partial Saturation

B.6.3→Progressive failure

B.6.4→Strain incompatibility

B.6.5→Other Strain-Related Considerations.

B.6.6→Comments on Undrained strength ratio

B.7 → References

Appendix C: Stability Analysis Framework for Tailings Dams with Contractive Soils

Dam Failure Consequence Classification<	Incremental Losses				
	Population at Risk ¹	Potential Loss of Life ²	Environment ^{3,4}	Health, Social & Cultural	Infrastructure and Economics ⁵
Low	none	none	Minimal short-term loss of environmental values. No expected impact on livestock / fauna drinking water. Limited area of impact and restoration feasible in short term.	Minimal effects and disruption of business and livelihood. No measurable effects on human health. No disruption of heritage, recreation, community or cultural assets.	Low economic losses: area contains limited infrastructure or services.
Significant	1-10	none	Limited loss or deterioration of environmental values. Potential contamination of livestock/fauna water supply. Moderate area of impact and restoration possible.	Limited effects and disruption of business and livelihood. No measurable effects on human health. Limited loss of regional heritage, recreation, community, or cultural assets.	Losses to recreational facilities, seasonal workplaces, and infrequently used transportation routes. Moderate economic loss.
High	10-100	1 - 10	Significant loss or deterioration of critical environmental values. Potential contamination of livestock/fauna water supply. Potential area of impact 5 km ² to 20 km ² . Restoration possible within a moderate time frame.	Many people affected by disruption of business, services, or social dislocation. Significant loss of regional heritage, recreation, community, or cultural assets. Potential for Some short-term human health effects.	High economic losses affecting infrastructure public transportation, and commercial facilities, or employment. Moderate relocation / compensation to communities. Losses.
Very High	100-1000	10 to 100	Major loss or deterioration of critical environmental values including rare and endangered species of high significance. Potential area of impact >20 km ² . Restoration or compensation possible but very difficult and requires a moderate to long time frame.	A high number of people affected by disruption of business, services, or social dislocation for more than one year. Significant loss of national heritage, recreation, or community facilities or cultural assets. Significant long-term human health effects.	Very high economic losses affecting important infrastructure or services (e.g. highway, industrial facilities, storage facilities for dangerous substances), or employment. High relocation/compensation to communities.
Extreme	> 1000	> 100	Catastrophic loss of critical environmental values including rare and endangered species of high significance. - Very large areas of potential impact. . Restoration or compensation in kind impossible or requires a very long time.	A large number of people affected by disruption of business, services, or social dislocation for years. Significant National heritage or community facilities or cultural assets destroyed. Potential for Severe and/or long-term human health effects.	Extreme economic losses affecting critical infrastructure or services (e.g. hospital, major industrial complex, major storage facilities for dangerous substances or employment. Very high relocation/compensation to communities and very high social readjustment costs.

Consequence Classification

Similar to GISTM

Flood Design

Table 7.2 Suggested **minimum** flood design criteria for operating & active care phases

Consequence Classification	Flood Criteria -- Annual Exceedance Probability (AEP) ¹
	Operations and Active Care Closure
Low	1/200
Significant	1/1,000
High	1/3 rd between the magnitude of the 1/1,000 flood and the PMF
Very High	2/3 rd between the magnitude of the 1/1,000 flood and the PMF
Extreme	PMF

Note: 1) The criteria presented is guidance for suggested minimum criteria.

Seismic Design

Consequence Classification	Seismic Criteria ¹ Annual Exceedance Probability ² or Maximum Credible Ground Motion ³
	Operations and Active Care Closure
Low	1/200
Significant	1/1,000
High	1/2,475 ⁴
Very High	1/5,000 or 50 th percentile MCE ^{1,3}
Extreme	1/10,000 or 84 th Percentile MCE ^{1,3}

Notes:

- 1) The selection of the probabilistic or deterministic (scenario-based) design earthquake ground motions should consider the seismic setting and the reliability and applicability of each method.
- 2) The criteria associated with annual exceedance probabilities (AEP's) presented are guidance for suggested minimum criteria. Each facility should be assessed for the potential to increase the design criteria to further reduce risk.
- 3) MCE is based upon a deterministic seismic hazard assessment that considers a range of scenarios.
- 4) The selection of an AEP of 1/2475 as a minimum design earthquake for High Hazard is based on the typical design earthquake for buildings in certain building codes, the application of this value for dam safety in multiple countries, and its inclusion in the GISTM.

Stability Analysis

Stability Condition	Target Minimum Factor of Safety
Static Conditions	1.5
Post-Liquefaction Conditions	1.1

- **Key** element of the safety evaluation of tailings dams
- Most often based upon Factor of Safety (FOS) values calculated using **limit-equilibrium (L-E) analyses**. This is adequate where materials comprising the foundation and the structural zones of the tailings dam are expected to be **dilative** over the full range of operating conditions over the life of the facility (**detailed discussion in Appendix A**)
- Need to consider **drained & undrained** situations
- Need to assess **residual strength** post seismic for **contractive** materials (**Appendix B**)
- **Minimum FOS** assuming leading international practice has been adopted with respect to: site characterization, selection of parameters and design methodology
- Alternatively, stability analyses can be carried out using advanced numerical models - **non-linear deformation analyses** (NDA) based on stress-strain relationships.

Tailings Storage Facilities in Central Asia

- Tajikistan:
 - 13 Tailings Storage Facilities
 - 10 Active
- Kyrgyzstan
 - 56 Tailings Storage Facilities
 - 13 Active
 - 50 greater than 30 years old
- Uzbekistan:
 - 16 Tailings Storage Facilities
- Upstream constructed tailings dams?
- Regulations provided limited technical guidance
- ICOLD Tailings Dam Safety Bulletin can supplement local regulations

Stability Analysis

- **Upstream tailings dams must be analysed for liquefaction**
- Seismic and static triggers are present
- Closure – assume liquefaction can occur
- Ignoring liquefaction stability → unsafe
- Failures in Brazil in 2015 and 2019 followed regulations, ignored liquefaction stability
- ICOLD stability addresses this in detail

<https://youtu.be/QEduIBYY6Xw>

Figure 19: Dam I Cross-section, Showing Raisings and Stages of Construction⁸

Brumadinho Failure – 2019
From panel report

Conclusion

- **ICOLD** have developed a **comprehensive guideline** covering all aspects of tailings dam safety considerations
- The guideline particularly focusses on **technical aspects** to underpin other industry initiatives
- Particular attention to factors & methods affecting **stability assessment**
- This is **ICOLDs contribution** to help eliminate tailings dam failures such as Samarco & Brumadinho
- Supplement regulation, not replace

Thank You for your attention
