Air Quality

Worldwide an increasing number of citizens live in urban areas, where high population densities and economic activities cause high levels of air pollution.

The exposure to high levels of air pollution is linked to adverse health effects, such as respiratory and heart problems, and cancer. Particulate matter (PM), ozone (O₃), nitrogen dioxide (NO₂), sulfur dioxide (SO₂) and benzo[α]pyrene (BaP) are associated with serious health problems

Air Quality

The World Health Organization (WHO) has issued recommendations regarding the acceptable levels of air pollution.

The levels recommended in the latest edition of the WHO air quality guidelines from 2021, based on the latest scientific evidence, are very strict.

Air Quality

The long-term objective could be set to achieve zero exceedances of the WHO guideline levels for human health.

The World Health Organization recommendations has led many governments to issuing air quality legislation related to the protection of human health

Apart from direct emissions of pollutants, O_3 is a secondary pollutant formed from other pollutants in the presence of solar light. Its levels are determined by emissions and meteorology.

PAGE TREE

- Revised Guidelines for the Applica

Environmental quality	Forests	D-3.1	Forest area as a proportion of total land area (SDG indicator 15.1.1)	
		D-3.2	Share of other wooded land in country area	
		A-2.1	PM ₁₀ : Number of days with exceeded daily limit value	
		A-2.2	SO ₂ : Number of days with exceeded daily limit value	
		A-2.3	O ₃ : Number of days with exceeded daily limit value	
	A-2.4	NO ₂ : Number of days with exceeded daily limit value		
	A-2.5	PM _{2.5} : Number of days with exceeded daily limit value		
	Freshwater quality	C-?	Indicators to be identified	
	Marine water quality	C-?	Indicators to be identified	
	Environmental resources and their use	Energy resources	Production, trade and consumption of energy	G-1.1
G-1.2				Final energy consumption
G-1.3				Total energy use by the national economy
G-1.4				Energy use by resident households per capita
G-2.1				Total primary energy supply (TPES)

Code	Indicator	Priority
A-2.10	PM ₁₀ : Annual mean concentration in cities*	Yes
A-2.8	Annual mean level of PM ₁₀ in cities (population weighted) (SDG indicator 11.6.2)*	Yes
A-2.1	PM ₁₀ : Number of days with exceeded daily limit value	
A-2.9	PM _{2.5} : Annual mean concentration in cities*	Yes
A-2.7	Annual mean level of PM _{2.5} in cities (population weighted) (SDG indicator 11.6.2)*	Yes
A-2.5	PM _{2.5} : Number of days with exceeded daily limit value	
A-2.11	SO _x : Annual mean concentration in cities*	Yes
A-2.2	SO ₂ : Number of days with exceeded daily limit value	
A-2.3	O ₃ : Number of days with exceeded daily limit value	
A-2.12	NO _x : Annual mean concentration in cities*	Yes
A-2.4	NO ₂ : Number of days with exceeded daily limit value	

Air quality

System design

Definition of the parameters to be measured

Definition of the measuring instruments for each measuring station

Definition of the number of necessary measuring stations to cover fully the areas of interest (major cities, industrial areas, airports etc.)

Establishment of the position of the measuring stations

Definition of the method for data transmission to the database

Geographic Information System

- Software for the display of information on maps
- Connection with the parameters' measurements database

Geographic Information Systems - GIS

Attributes

Position on the map for the
sampling point (Georeferenced)

Differentiate depiction dependent
on the parameter value

Interoperability with the database

GIS

Attributes

Geodetic reference system

Resolution

Topology structure of the vector data models: points, lines and polygons

GIS

Types of data

Base Map

Geographic Database

Raster data

Vector data

Geographic data

GIS – Base map

Definition of scale for the whole territory (e.g. 1: 250.000, 1: 100.000, 1: 50.000)

Definition of scale for urban areas (e.g. 1:5.000)

Data in both vector and raster format is required to allow use of GIS analysis tools

Homogenization of the data

Sources: Satellite imaging, Orthophoto maps

Digital Terrain Model (DTM)

Attention to copyright issues

GIS – Vector data

Naming rules

Road network with names, numbering from-to, left-right and postal code

Building blocks with population data for urban areas

Boundaries of municipalities, prefectures and regions

Coastline, Rivers, Lakes, Plains, Altitude zones, Settlements

GIS

Raster data is a pixel-based picture data (e.g. JPG, PNG, TIFF) that is stored in the GIS

Geographic database: Spatial information + Descriptive information, connected by a common key

Geographic data refers to data (environmental data in this case) that is associated with a specific location

GIS

Layers of geographic information necessary for the correct display of environmental data

Naming information for the whole territory

Road network

Settlements

Coastline, Rivers, Lakes

Plains, Elevation Zones

Road network with naming, numbering from-to, left-right and postal code for the major metropolitan areas

Building blocks for the major cities, with population data

Protected areas

Geotopes, Geoparks

Archaeological sites

Air quality

GIS functionality

Display air pollutant concentration values for a selected measuring station

Allow the registration of the location of a new measuring station

Air quality

Geographical data

Air pollution measuring stations

Registration of the location of all measuring stations in the urban complex on a base map of a chosen scale (e.g. 1: 5.000)

GIS - Metadata

- Geographic data is supplemented by Metadata ("Information for Information")
- The metadata describes elements of identification, ownership, content, structure, availability and method of delivery.
- For the integration of downloaded data to the host database and to ensure appropriate use depending on the host application, the following data information and quality indicators should be provided:
 - Data source
 - Accuracy (position and thematic properties)
 - Data relevance
 - Logical data consistency
 - Completeness

Collection of data

Method

Automated

Manual data entry

Sample collection

Recurring studies

Collection of data from other sources

Questionnaires

Input of data to the data storage

Method

Using a system link to/from the measuring device

Using a user interface software tool

Using bulk download

Direct entry of the data to the data storage device through mobile systems

Collecting data from the responsible authority

Air Quality

Data collection

Network of measuring stations

Direct communication link from the measuring station to the database site

Dedicated software for the transmission of the recorded pollutant data on the station, to the database

GIS data : Air pollution measuring stations, point topology

Accreditation

The use of certified equipment ensures the validity and comparability of the measurements.

Certification may be obtained by an accredited certifier.

EN ISO/IEC 17025 is the standard for testing and calibration laboratories

Data validation

Statistical tools

Mean

Standard deviation

Relative standard deviation.
Coefficient of variation

Environmental Information

Indicators

Dynamic reports that present information from the database in a highly consolidated form

Easy graphical end-user interface that allows the detection of deviations from predefined goals or from previous time periods

Features to facilitate the detection of exceptions and to drill down to more detailed data

Environmental Information

Analysis and display

Dedicated internet site

Indicator based reports

State of the environment reports

Benchmarking

SQL Reporting tools

Spatial analysis tools

Trends and future projections

Statistical Tools for Environmental Data Analysis

Correlation analysis

Example : Air quality

Correlation analysis between NO and O₃ for all measurement stations in a city over a year. The low value of **R-Sq** means that the two pollutants are weakly related.

Regression Analysis: LOGE(5) versus LOGE(2)

The regression equation is

$$\text{LOGE}(5) = 5,10 - 0,656 \text{ LOGE}(2)$$

32998 cases used 1346 cases contain missing values

Predictor	Coef	SE Coef	T	P
Constant	5,09533	0,00887	574,36	0,000

LOGE(2)	-0,656026	0,002936	-223,45	0,000
---------	-----------	----------	---------	-------

S = 0,8051 **R-Sq = 60,2%** R-Sq(adj) = 60,2%

Statistical Tools for Environmental Data Analysis

Hypothesis testing

Locating the measuring station
with the highest air pollution
load

Comparison per pollutant

Overall comparison between all
measuring stations in a city

Levels of access to information

Policy makers

Dedicated reports

Time series

Levels of access to information

Public administration

Availability of data to other Agencies (Ministries, Institutes, Universities, Research Centres) and Data Schemes within the country

Levels of access to information

Public Website

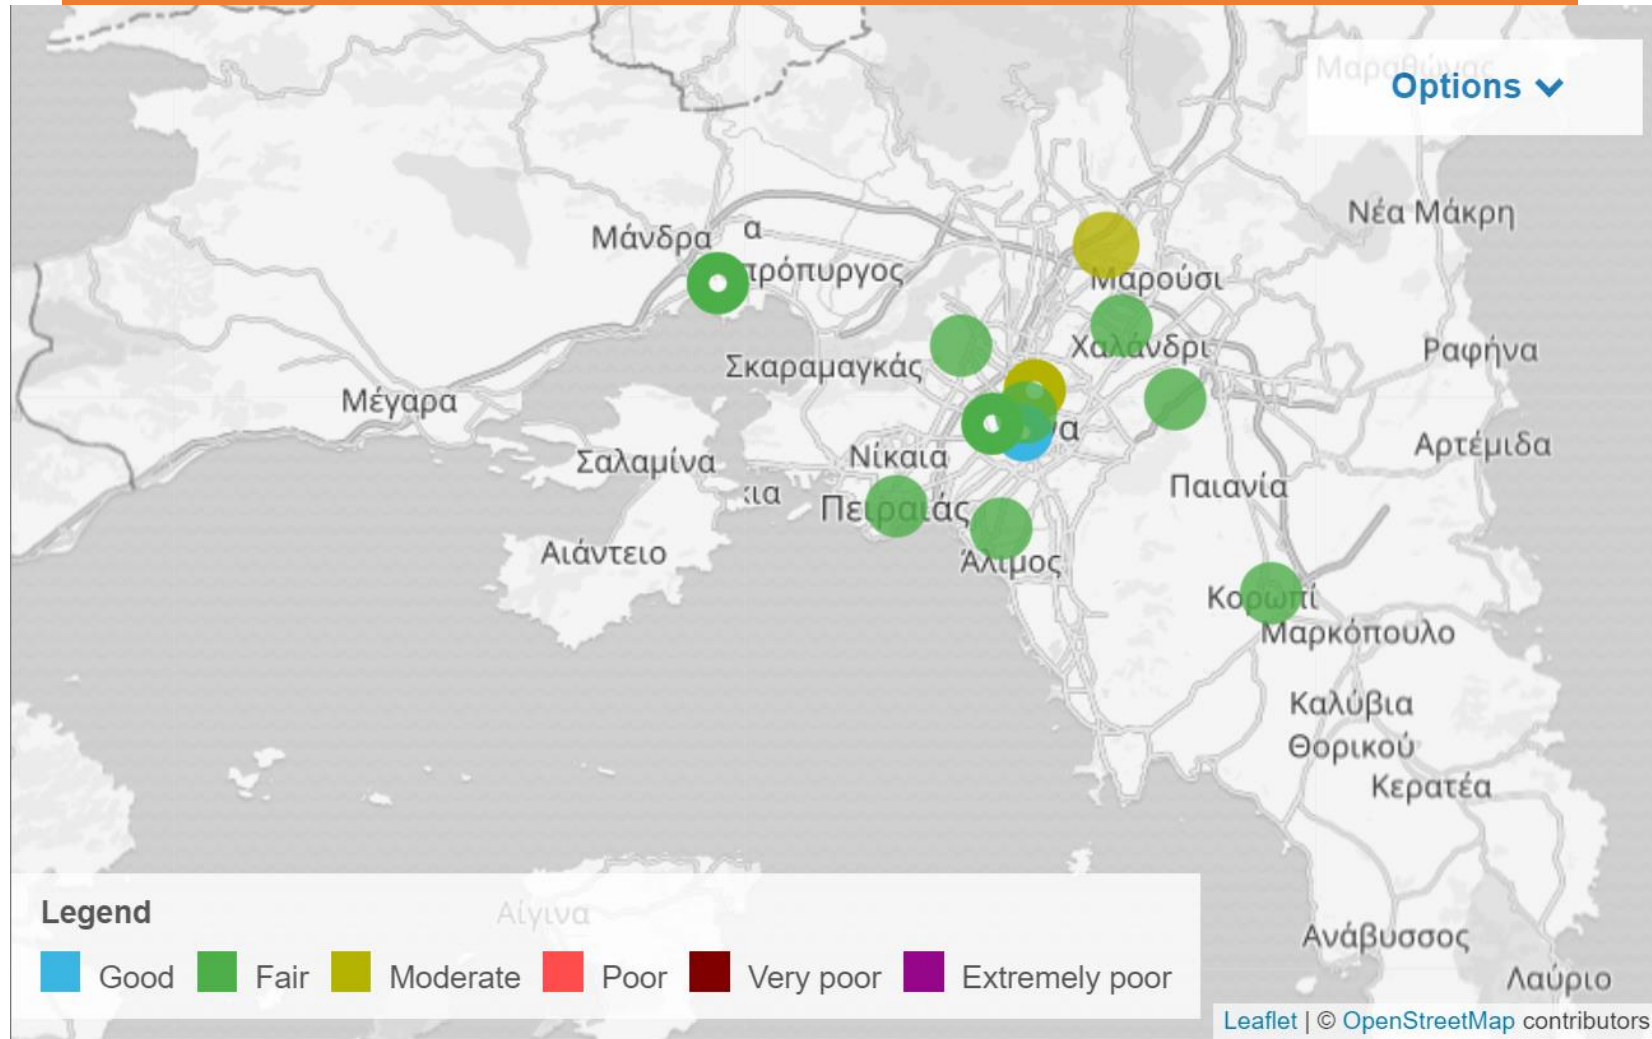

Time series

Aggregated data

Ready to display graphics and GIS maps

Athens area Air quality monitoring network

Use indicators values to produce State of Environment Reports
