

**Global Workshop**  
**on Droughts in Transboundary Basins**  
 26-27 February 2024, Geneva

**Management of groundwater and surface water in transboundary basins in the Arab region (Monitoring – Data exchange )**

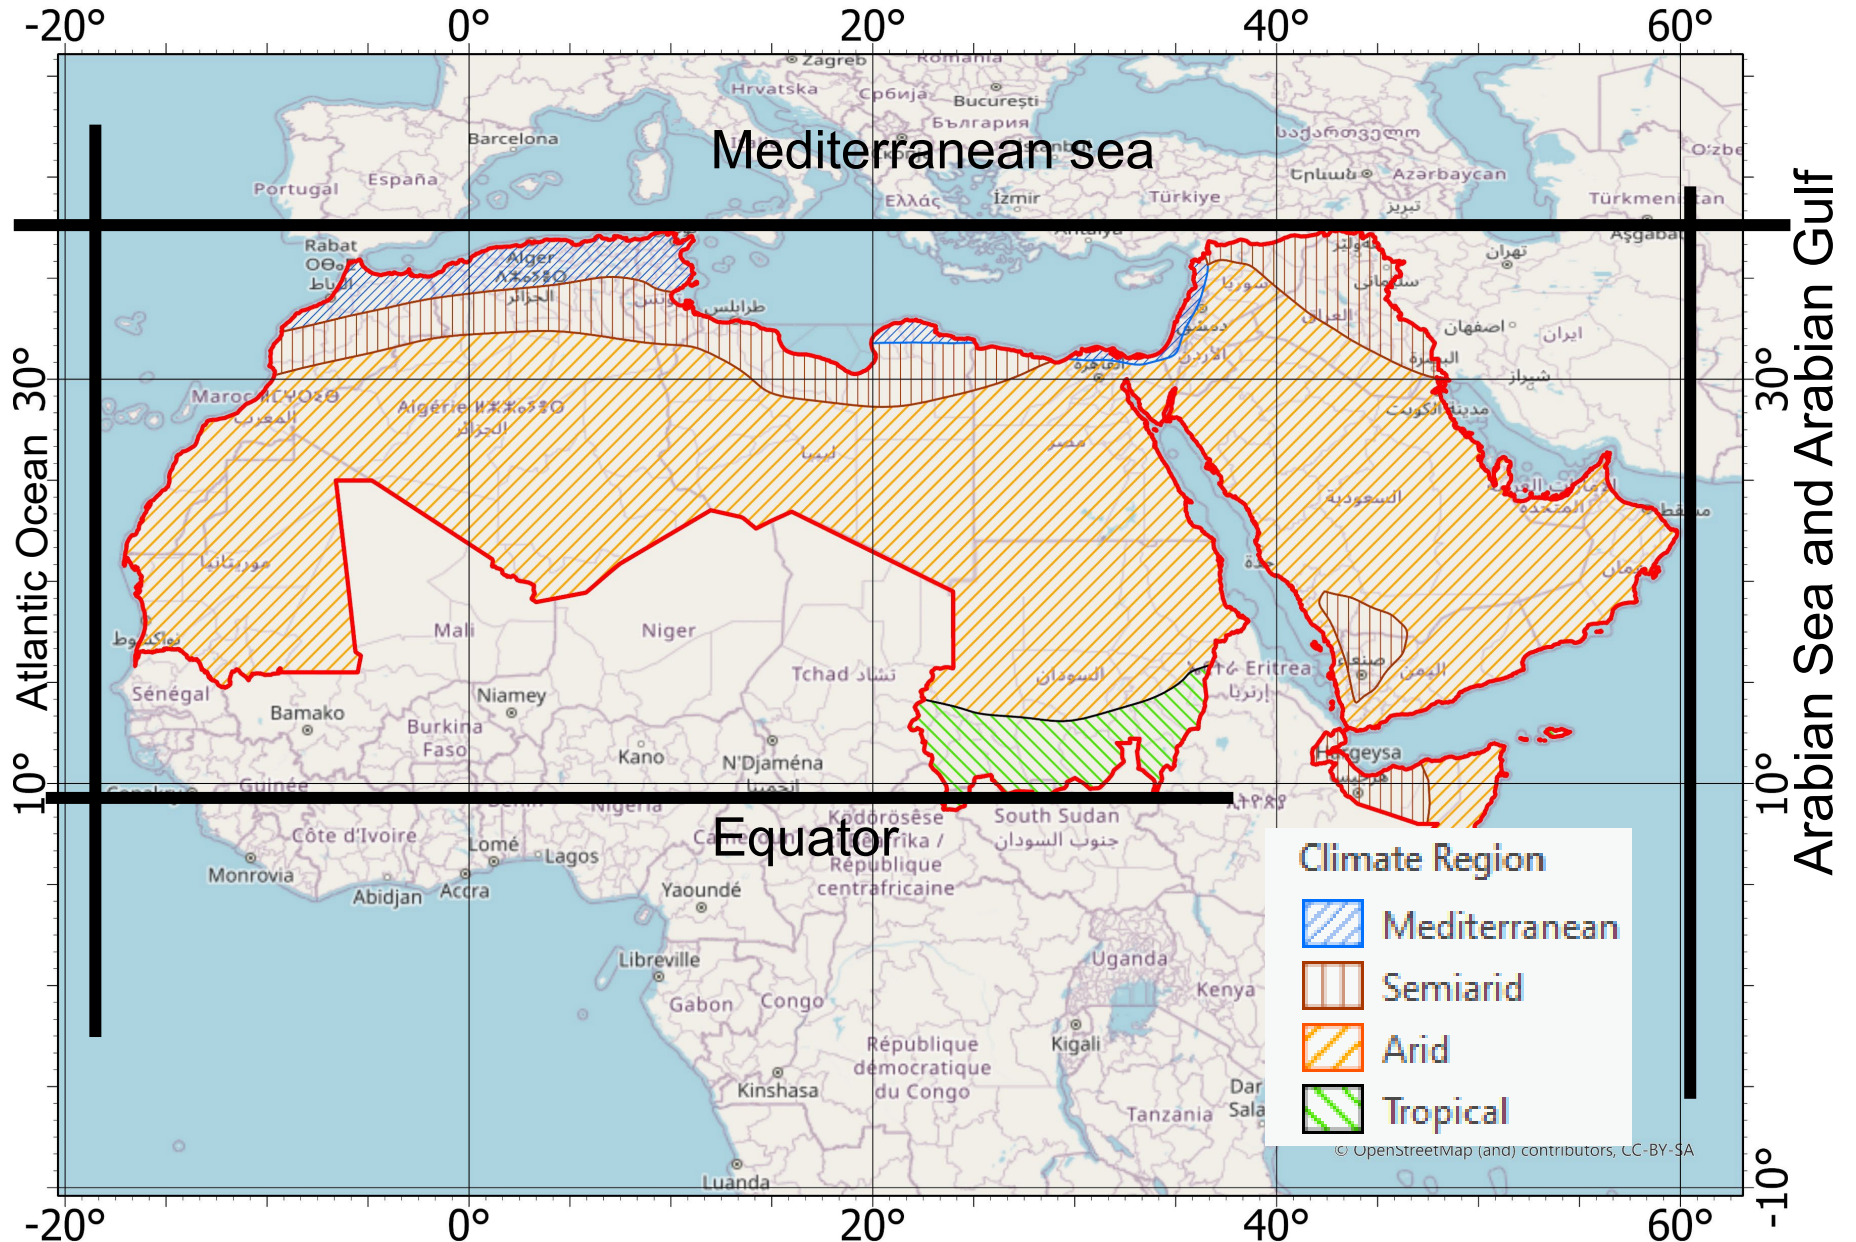

**Kassem Natouf**  
 Syria/ACSAD

# The Arab region

- **Boundaries.**
- **Area:** 14 M.Km2, & **Total Population** 430 M. Inhabitants
- **Shared Water** = 2/3 of fresh water resources
- **27** shared Surface water basins
- **14** of 22 Arab countries are riparian States with a shared waterbody
- **Traditionally the region faces drought events with increasing number of droughts, leading to vulnerabilities in agriculture and food and water securities and impacting livelihoods.**
- **Some adaptation measures :**
  - I. water conservation (Improved Irrigation Practices)
  - II. Diversification of Water resources & Crops
  - III. Policy Measures (Raising Awareness & Alarm systems)

# Water Resources Monitoring

## Groundwater

## Surface Water

### Quantity

### Quality

### Quantity

### Quality

Groundwater Level

Springs discharge

Groundwater Abstraction

Salinity

Ions / Cations Concentrations

River Discharge

Dams & Lakes Storage

Water Usage

Salinity, Ions, Toxic Substances

Main water resources drought Indicators

Facilities

Groundwater Monitoring Network

River & Springs Gage Stations

Laboratories

Sampling Team

Tools

### Manually

Groundwater Level Meter

Current Meter

### Automated

automatic groundwater level & river stage monitoring device

# Drought Monitoring

## Remote Sensing

Main Indicators

NDVI - Normalized Difference Vegetation Index

SPI - Standardized Precipitation Index

SMP - Soil Moisture Percentile

SMDI - Soil Moisture Deficit Index

VHI - Vegetation Health Index

Advantages

large spatial and temporal resolution.

near-real-time drought analysis

integration with other data sources and models

Disadvantages

atmospheric conditions

sensor errors

calibration issues

uncertainties and errors in estimating drought

Remote sensing is a valuable yet not standalone tool for drought monitoring. It needs to be supported by ground-based observations, meteorological data, hydrological models, and socio-economic indicators to offer a thorough and precise evaluation of drought conditions and risks.

## Example

Food and Agriculture Organization of the United Nations

Language options: العربية, 中文, English, Français, Русский, Español

Navigation: Home, Seasonal Global Indicators, Global Indicators, Country Indicators, Data Access, FAQs, Reference, Research, Partners

Country ASIS

The country level maps and graphs depict the latest 36-month period of the seasonal, vegetation and precipitation indicators. The data is presented by dekad and month. [More](#)

### DISCLAIMERS

The boundaries and names shown and the designations used on the maps do not imply the expression of any opinion whatsoever on the part of FAO concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers and boundaries.

### Syrian Arab Republic

Another country:

Seasonal Indicators: Vegetation Indicators, Precipitation Indicators

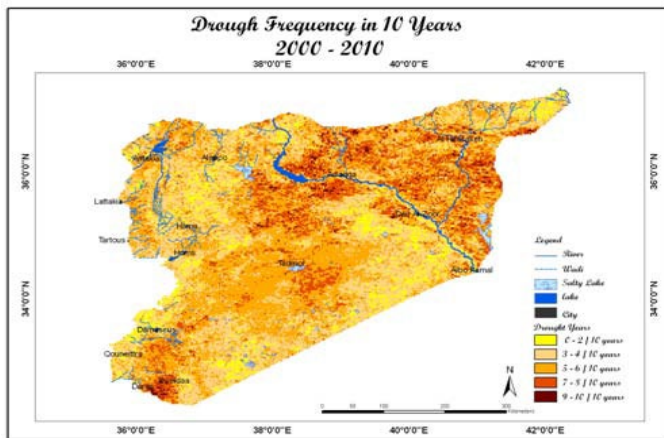

Cropland: Grassland

Near Real Time (10 days): Annual Summary, Historic Drought Frequency, Crop-growing Season

Season 1, Season 2

Agricultural Stress Index: Drought Intensity, Weighted Mean Vegetation Health Index

Agricultural Stress Index [More](#)

Drought Frequency in Ten Years

## VEGETATION HEALTH INDEX

### Legend

- VERY GOOD SEASON
- GOOD SEASON
- MODERATE SEASON
- BAD SEASON

SEASON - 2000 - 2001

SEASON - 2001 - 2002

SEASON - 2002 - 2003

SEASON - 2003 - 2004

SEASON - 2004 - 2005

SEASON - 2005 - 2006

SEASON - 2006 - 2007

SEASON - 2007 - 2008

SEASON - 2008 - 2009

SEASON - 2009 - 2010

# Water Resources / Data Exchange

## Old Traditional Way

Exchanging documents and data at meetings and official correspondence between joint water committees and ministries of water resources in riparian countries

## Digital Databases

Design and implement digital databases that receive data related to drought indicators related to water resources and provide access to them for specialists and decision-makers

## Advantages

- IWRM in Transboundary Basin
- Information data accuracy & reliability
- Exchanging of knowledge & understanding of water resources in Transboundary Basin

Efficiency

Accuracy

Collaboration

Customization

Security

## Disadvantages

- Conflicting and divergent data and information may complicate the process of water resources management
- Sharing sensitive information and data may pose a challenge .
- may raise the issue of ownership and accessibility

Cost

Maintenance

Complexity

Data Privacy

According regional strategic action programme for the NSAS

Regular exchange of data

Management framework

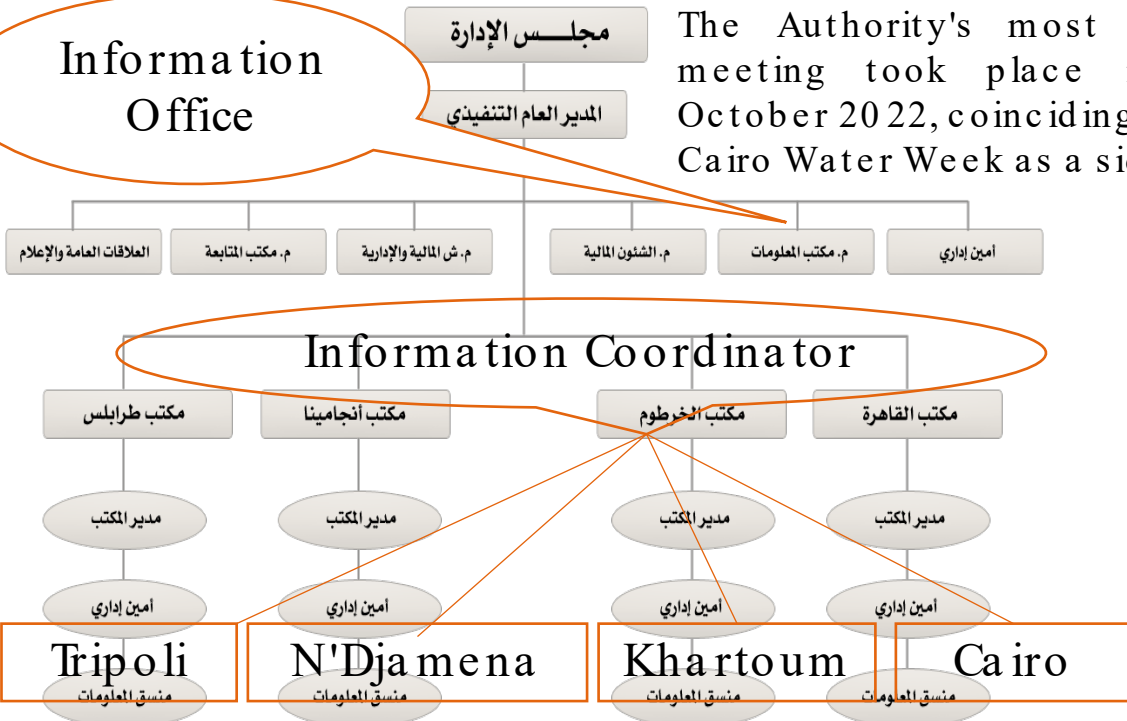

Policy document, (strategy & management principles)

1a.5: Implement, maintain and utilise a transboundary monitoring network and information database providing comparable information to assess the status of water and biological resources of the NSAS

Old Traditional Way / Joint authority for the Development and studies of the NSAS

Information Office

The Authority's most recent joint meeting took place in Cairo in October 2022, coinciding with the 5th Cairo Water Week as a side event.

Digital Databases (Examples / Non Arab Regions)

- Aral Sea.
- River Plata Basin
- Mexico- US Basin
- BIO- PATEAUX Project
- .....

Almost all each Arab country has National Water Resources Database

### Related to monitoring

- 1. It is necessary to train a technical staff capable of carrying out manual and digital measuring work with integrity, efficiency and high professionalism.**
- 2. There must be an incentive system that strengthens the sense of responsibility and ownership of the measurement system to ensure its sustainability.**
- 3. The digital monitoring system is necessary in order to achieve speed and efficiency of measurement work, especially in developing early warning systems**
- 4. Periodic manual measurements can be a verification method to ensure that the digital system is working properly**
- 5. The ground observation system must be supported by a digital computer system that benefits from remote sensing operations and global climate systems to complete and verify data.**

### Related to data Exchange

- 1. Data management is the practice of collecting, organizing and utilizing data as valuable assets in the management of water resources in transboundary basins.**
- 2. Data management should include processes such as sourcing, transforming, cleaning, storing, protecting, analysing and sharing data.**
- 3. Data sharing is the process of enabling access to and use of data by different parties in riparian states.**
- 4. Data exchange is an essential process in water resources management in transboundary basins because it contributes to improving efficiency, cooperation, innovation and decision-making in these basins.**
- 5. Designing digital databases helps reduce errors and costs and increase speed, quality, and compliance.**
- 6. When designing digital databases to exchange data, it is necessary to:**
  - Apply electronic data interchange standards (rules and agreements that specify how data is exchanged between different systems and applications).**
  - Having appropriate platforms, protocols, policies and security.**
  - Find a common language for data exchange and create a framework for data formatting, message structure, and content.**
