Climate change in WB

Climate change hotspots

Change in annual precipitation by the 2050s

Increase

♦ Decrease

Temperature increase by 1.7-2.3°C by 2050 across the region (depending on the model and scenario)

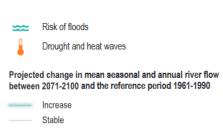

Present risks intensified by climate warming

Risk of forest fires

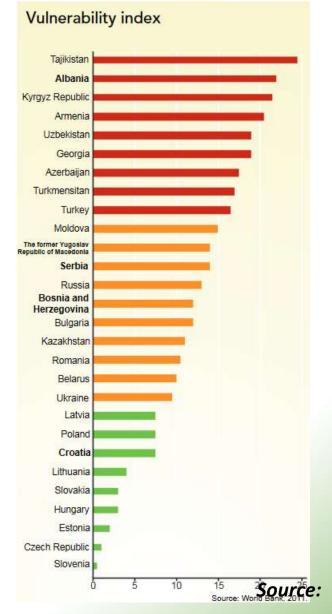

Risk of desertification

Risk of decreasing farming productivity and risk of failures of rain-fed crops

Sea level rise impacts on coastal erosion and salt water intrusion

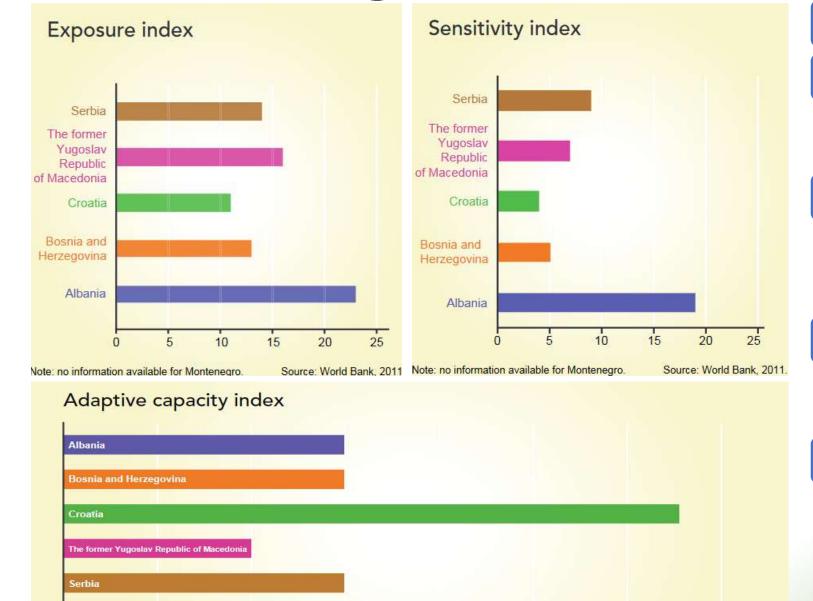

Decrease

Climate change in Albania

12

Main conclusions of the study report

Temperature:

 Projections indicate an increase in average temperatures by up to 2.5°C by 2050, with more extreme heat events expected.

Precipitation:

 Winter precipitation is projected to increase by up to 10-20%, while summer precipitation may decrease by up to 20-30%, leading to higher risks of both flooding and droughts.

Water Availability:

 Runoff is expected to decrease by approximately 20% by 2050, impacting hydropower production and irrigation for agriculture.

Sea Level Rise:

 Sea levels along the Albanian coast could rise by up to 0.8 meters by the end of the century, affecting coastal infrastructure and ecosystems.

Albania strategic response to Climate Change

- ✓ 2014 Established the Interinstitutional Working Group for Climate Change, by order of PM no 155 dated 25.4.2014
- ✓ 2015 Albania adopted by DCM the Intended Nationally Determined Contributions INDC under UNFCCC for the objective under 2°C
- ✓ 2016 Albania launches plan to prepare for climate change impacts through its National Adaptation Plan (NAP)
- ✓ 2017 Mainstreaming adaptation into Albania's Medium-Term Budget Process 2018-2020 (The obligation of the ministries to identify climate adaptation measures at the program/objective/project/product and activity level became part of the annual guideline for the preparation of MTBP 2018–2020 issued by the Minister of Finance. Between March and May 2017 (as the first phase of MTBP process), climate adaptation-related prevention and resilience measures were identified among existing government program policies and projects, and additional adaptation outputs were set.
- ✓ 2019 National Strategy on Climate Change (NAP) was adopted by government through DCM 488 dated 3.7.2019
- ✓ 2023 <u>Albania's National Adaptation Plan: First progress report</u> was delivered by Ministry of Tourism and Environment.

Implementation of Flood Risk EU Directive in Albania

Conclusion and challenges

Awareness has been raised regarding the importance of climate change, which is clearly seen from the political will shown by the Albanian government in the last 10 years through the creation of a strategic framework.

Climate change has managed to be included as a concept in most strategic and planning documents, but still is difficult to concretized it in specific actions, as the specific indicators for assessing the impact are also difficult to be defined and measured.

Regarding capacities and human resources, there is a limited understanding of the practical application of climate change, and this is perhaps a global problem.

So far, we can say that a top-down approach has been followed; meanwhile, to achieve effectiveness and results, the climatic elements in the bottom-up approach need to be strengthened, and sectors need to be interconnected at the operational level.

The most practical and tangible element that can be understood by everyone regarding climate change are water resources. In this aspect, special attention is needed to be concretize as many elements of climate change as possible into concrete projects in the water sector.
